## Executive Summary

The State Route (SR) 512 Corridor Study identified strategies to address multimodal connectivity and operational performance gaps along and across the corridor. As shown in Figure ES- 1, SR 512 provides access across southern Pierce County from Lakewood to Puyallup. Through connections to SR 410, SR 167, and I-405, SR 512 is also a key element of an important regional alternate to I-5. It also serves as the primary connection for freight movement between I-5, the Port of Tacoma, and industrial and warehouse areas throughout central and south Pierce County.

Nearly all segments of the SR 512 corridor currently experience travel delays for several hours during both the morning and afternoon peak travel periods. Several of the interchanges and intersections that provide access to SR 512 regularly fail to meet WSDOT performance criteria for multiple hours of the day. The corridor also suffers from a general lack of transit service coverage and substantial discontinuities in active transportation infrastructure, especially serving people who want to cross SR 512. These performance gaps impact the economic vitality, safety performance, and resiliency of the highway itself and adjacent and connecting roadways. Multimodal travel forecasts for the corridor show increased demand for movement of people and freight, and future changes in travel patterns.

Figure ES-1. Study Corridor

Study Approach
WSDOT engages the community and local stakeholders at the earliest stages of need identification and strategy definition to be sure their input is included throughout the project development process. The SR 512 Corridor Study included three engagement elements:

Study Advisory Group - Leadership and staff from local jurisdictions and transportation agencies, non-governmental organizations, and tribes were invited to help guide the study. The group met five times during the study process to provide input on the study goals, evaluation criteria, and potential strategies.

Strategic Interviews - The project team conducted interviews with key leaders and constituents to gather information about how they use the corridor, specific observations and concerns, and desired study outcomes.

Virtual Public Open House - This online open house gave the public the opportunity to learn about the study and provide input via a survey.

Transportation Performance Gaps and Strategy Development. The study team developed Initial strategies from three sources that yielded valuable information regarding performance gaps in the study area: review of existing plans, input from the outreach and engagement process, and the travel demand forecasting conducted for this study.

Evaluation Process. Criteria were developed to evaluate strategies and were reviewed with the Study Advisory Group. These criteria included:

- Multimodal mobility and connectivity
- Safety performance
- Equity
- Economic vitality
- Resiliency
- Freight/goods movement
- Environment
- Reliability
- Practical solutions/state of good repair
- Implementation and partnerships

Each strategy was evaluated for each criterion to the degree it could provide an improvement over Baseline conditions, meaning if none of these strategies were implemented over projected future conditions. This led to some strategies being divided or combined. Strategies were then assigned an implementation timeframe using the intent of the WSDOT Practical Solutions paradigm: the right solution in the right place at the right time.

## Key Findings

This evaluation process yielded 42 recommended strategies to address transportation performance gaps, both corridor-wide and location-specific, that will lead to the realization of a strong vision for integrated, sustainable, and equitable mobility in the SR 512 corridor. Summarized below, these strategies are shown in Figure ES- 2, Figure ES- 3, Table ES-1 through Table ES-5, and Table ES- 7 through Table ES- 10. Planned and programmed projects for the study region can be found in Table ES-6.

Corridor-Wide Strategies. Of the recommended strategies, nine are applicable throughout the corridor including Transportation System Management and Operations, Active Transportation and Crossings, Managed Lanes, and Transit. Most are identified as feasible for near-term implementation.

Location-Specific Strategies. Thirty-three of forty-two strategies are location-specific and span all five strategy types. Most of these fall within the Active Transportation and Crossings and Strategic Bottlenecks categories. These location-specific strategies trend toward mid- and long-term implementation.

## Next Steps

The strategies identified here are recommended for consideration by WSDOT and other agencies going forward. The most important next step is to refine and reconcile them with local and regional plans and incorporate them as those plans are updated. Once these strategies are included in such planning documents, funding assistance can be sought and additional project definition, refinement, permitting, and design activities can begin. Some strategies identified here could be combined with others or broken down into smaller parts to assist in these pre-implementation activities.

## Chapter 1 Introduction

State Route (SR) 512 is an important east-west link through Pierce County that connects the cities of Lakewood and Puyallup. This highway provides a vital connection between Interstate 5 (I-5) and SR 167 for residents, businesses, and visitors. Travelers using SR 512 often experience congestion and delays while commuting, transporting freight, or traveling locally for goods and services. This study identified potential near-, mid-, and long-term alternatives to improve operations, safety, and mobility for all users. Recommendations published in the study report will be used to pursue future funding for highway design and construction improvements.

The study corridor traverses several cities and communities, and includes medical facilities, businesses, schools, and social services. WSDOT consulted area stakeholders and communities to understand their experiences on SR 512 and gather feedback on potential strategies.

### 1.1 Study Area

The SR 512 Corridor Study focuses on freeway operations between I-5 and SR 167 with specific consideration of interchanges, ramp terminal intersections, and other intersections that could impact SR 512 operations. Many of these other intersections are located along 104th Street E and 112th Street E, which are adjacent parallel arterials north and south of SR 512, respectively. WSDOT analyzed a total of 37 intersections in addition to the SR 512 freeway as part of the study. The study area is shown in Figure 1-1.

Figure 1-1. Study Area Map

### 1.2 Need Statement

In 2021, the legislature passed Substitute Bill 1137, amending Revised Code of Washington (RCW) 47.04.280, to reprioritize the State's six transportation system planning goals for making investments in public transportation. The bill elevated the policy goal of "Preservation" to the top of the list directing the State to, first and foremost, "maintain, preserve, and extend the life and utility of prior investments in transportation systems and services, including the state ferry system." Safety remains the second goal among priorities, defined as "To provide for and improve the safety and security of transportation customers and the transportation system." This bill further emphasized in its legislative intent that
preservation and safety are to be the main priorities among the State's six transportation system planning goals. These goals are the foundation of WSDOT system planning efforts.

Consistent with this direction, this SR 512 Corridor Study seeks first to identify strategies to maintain and improve the performance of the existing investments in SR 512 and its connecting and supporting facilities in terms of safety, equity, and other important measures. The study also examines needs over the longer term for the purpose of identifying additional strategies that close performance gaps.

To help guide the definition of performance gaps, and the development of improvement strategies, WSDOT developed the following statement in coordination with the Study Advisory Group:

## WSDOT Transportation System Planning Goals:

1. Preservation
2. Safety
3. Stewardship
4. Mobility
5. Economic Vitality
6. Environment
"The corridor currently exhibits recurring travel delays that impact the safety performance and resiliency of the SR 512 freeway and adjacent facilities. People who drive and those using active transportation modes experience different transportation benefits and challenges. Forecasts show increased demand for movement of people and freight as well as future changes in travel patterns. SR 512 is also part of an important regional alternate to I-5."

This statement of need led to the development of the following study goals:

- Hear a broad range of voices
- Meet the mobility needs of future users
- Improve safety, access, and travel times
- Identify potential strategies for implementation in:
o Near term
o Mid-term
o Long-term

### 1.3 Study Process

The study team began by collecting a range of data for use in studying the existing and future Baseline conditions. The team also reviewed local and regional planning documents to help set the context for this work and identify potential strategies for inclusion. The following studies were referenced to help identify performance gaps. The study team examined these studies with respect to the performance and function of SR 512 and nearby facilities, and identified high-level strategies based on their findings.

- South Pierce Multimodal Connectivity Study (in progress)
- SR 167 Master Plan (in progress)
- SR 167 Corridor Improvements Project (in progress)
- Puget Sound Gateway Program (in progress)
- Pierce Transit Bus Rapid Transit Expansion Study (in progress)
- I-5/SR 512 Interchange Improvement Project (2022)
- Long-range plans for Pierce County, Tacoma, Lakewood, Puyallup, Sumner, Sound Transit, and Pierce Transit (2015-2022)
- SR 512: Tacoma to SR 167 (Puyallup) Corridor Sketch (2018)
- SR 161 and 31st Avenue SW Corridor Study (2018)
- HOV Feasibility for I-5: JBLM to S 38th Street (2017)

The study team focused on early and consistent community engagement through interviewing stakeholders, convening the Study Advisory Group, and conducting an online open house. These activities resulted in meaningful and actionable input that fed directly into the study process.

The Practical Solutions approach formed the foundation of strategy development throughout, with a focus on system improvement for all users. Strategies were developed and evaluated using a range of criteria to identify the best candidates to recommend for near-, mid-, and long-term implementation.

## Chapter 2 Community and Stakeholder Involvement

### 2.1 Community Engagement

This study employed the Federal Highway Administration (FHWA) and WSDOT Practical Solutions approach to planning, a key feature of which is to engage the community and local stakeholders at the earliest stages to ensure their input is included throughout the project development process.

The SR 512 corridor traverses several cities and communities, and includes medical facilities, businesses, schools, and social services. WSDOT consulted with area stakeholders and communities to understand their experiences on SR 512 and gather feedback on potential improvement strategies.

WSDOT's approach to engagement had three components:

- Form an advisory group with representation from area jurisdictions, transit agencies, community organizations, schools, social services, and emergency services.
- Conduct interviews with organizations that represent and/or serve vulnerable populations and overburdened communities in the study area and/or different travel modes.
- Gather broad public input on SR 512 issues and potential improvements through an online open house and survey.

### 2.2 Study Advisory Group

WSDOT convened the SR 512 Corridor Study Advisory Group (SAG) to review and comment on study data and to provide strategic advice on near-, mid-, and long-term improvements to the highway. The project team invited representation from tribes, federal and state agencies, local jurisdictions, community organizations, schools, and emergency service providers. Members of the SAG are listed in Table 2-1.

Table 2-1. Study Advisory Group

| Organization | Name | Position |
| :--- | :--- | :--- |
| City of Edgewood | Jeremy Metzler | Public Works Director |
| City of Edgewood | Morgan Dorner | Senior Planner |
| City of Lakewood | David Bugher | Asst. City Manager/Community Development <br> Director |
| City of Puyallup | Ken Davies | Public Works Director |
| City of Puyallup | Meredith Neal | Economic Development Manager |
| City of Sumner | Michael Kosa | City Engineer |
| City of Sumner | Ryan Windish | Community Development Director |
| City of Tacoma | Jennifer Kammerzell | Interim Division Manager |
| City of Tacoma | Wesley Rhodes | Sr. Planner - Comp Plan |
| FHWA | Matt Pahs | Freight Transportation Planner |
| Franklin Pierce School District | Tim Bridgeman | Director of Transportation |
| Freight Mobility Strategic <br> Investment Board | Temple Lentz | Board Chair |
| JBLM | Darryl C. Abe | JBLM Public Works |
| Korean Women's Association | Mi-Yeoung Lee | Director of Social Services |
| Pierce County | Jennifer Tetatzin | Director of Planning and Public Works |
| Pierce County | Jesse Hamashima | Planning \& Public Works |
| Pierce County | Roxanne Miles | Director, Parks \& Recreation |
| Pierce Transit | Tina Lee | Principal Planner |
| Port of Tacoma | Christine Wolf | Senior Planner |
| Sound Transit | Eric Chipps | Senior Transportation Planner |
| Tacoma School District | Raymond Williams Jr. | Director of Transportation |
| Washington State Patrol | Stephanie Bjorkman | Trooper |
| Washington Trucking Association | Sheri Call | President/CEO |

Table 2-2. SAG Meetings
Meeting Date

## Agenda/Objective(s)

| January 12,2023 | Review the draft Problem Statement |
| :--- | :--- |
| February 16,2023 | Review existing conditions results |
| March 22,2023 | - Review future conditions results <br> - Review draft screening criteria and strategies |
| April 20,2023 | - Travel demand model comparisons <br> - Strategy evaluation results |
| May 18, 2023 | - Review operations analysis results and evaluation updates <br> - Establish recommended near-, mid-, and long-term strategies |

The Muckleshoot, Nisqually, and Puyallup Tribe of Indians, the Squaxin Island Tribe, and the Yakama Nation were invited to participate in the SAG but did not attend any meetings. Individual meetings with tribes were set up separately later in the study process.

SAG members provided availability for five meetings that represented key information-sharing and input milestones in the study process. Dates and topics are shown in Table 2-2.

### 2.3 Key Stakeholder Interviews

As part of study community engagement, WSDOT conducted interviews with organizations that represent and/or serve historically marginalized communities in the study area and/or advocacy for mobility, active transportation, and transit programs. The objectives of the interviews were to:

- Validate and build on the study problem statement
- Gather input on potential improvement strategies
- Engage those less likely to participate in broad-based outreach

The study team conducted a demographic analysis of the study area (within a 1-mile radius of SR 512) using information from the United States Census Bureau (2020 American Community Survey) to identify eight key population characteristics, including sex, age, race/ethnicity, household income, vehicle ownership, home ownership, household computer use and internet subscription, and language spoken at home/Limited English Proficiency. Based on the findings of the demographic analysis, WSDOT prioritized outreach to groups representing people who are Black, African American, and Filipino and translated information into Spanish and Korean.

The study team conducted 12 interviews in early 2023 with organizations representing multi-cultural groups, low-income groups, people of color, people with disabilities, seniors, active transportation advocates, schools and youth, freight and trucking, emergency services, and business. These key stakeholders and their interview dates are indicated in Table 2-3.

The interviews yielded several common themes. Most stakeholders expressed that the study should:

- Consider how SR 512 and connecting roads act as a barrier to mobility for those reliant on or desiring to travel via active transportation. This includes school-aged children.
- Address the SR 512/I-5 interchange, especially in the merge to southbound I-5. Most interviewees described the merge and use of the shoulder as unsafe.
- Add lanes along the corridor, including the consideration for managed lanes that transit and trucks can access.

Table 2-3. Key Stakeholder Interviews

| Stakeholder | Date |
| :--- | :--- |
| Asian Pacific Cultural Center | February 13, 2023 |
| Central Pierce Fire and Rescue | January 18, 2023 |
| ForeverGreen Trails | January 9, 2023 |
| Franklin Pierce School District | February 22, 2023 |
| Korean Women's Association | February 15, 2023 |
| Pierce College | February 21, 2023 |
| Pierce County Coordinated Transportation Coalition | January 4, 2023 |
| Puyallup School District | January 10, 2023 |
| Tacoma Pierce County Chamber | February 28, 2023 |
| Tacoma Public Schools | February 27, 2023 |
| Tacoma Urban League | February 28, 2023 |
| WTA (Washington Trucking Association) | February 8, 2023 |

### 2.4 Online Open House

WSDOT hosted an SR 512 Corridor Study online open house from February 27 to March 14, 2023, at engage.wsdot.wa.gov/sr-512-corridor-study. The goal of the online open house was to gather input on the SR 512 user experiences and priorities for improvements. The website content explained the scope of the SR 512 Corridor Study and asked visitors to complete a survey on their use of SR 512, challenges, and ideas for improvements. Content was provided in English, Korean, and Spanish. The site informed a broad group of the public about the SR 512 Corridor Study, as seen by the online open house web traffic shown in Table 2-4.

WSDOT received 805 completed surveys within the online open house, and 39 comments through the online open house comment form. Some questions allowed for multiple responses. Of those that completed surveys:

- Most respondents either live in the study area (57\%) or use SR 512 to get to other places/pass through (87\%).
- Most use the corridor frequently: daily (50\%) or at least once a week (33\%).
- The top three reasons for SR 512 travel were: shopping errands (84\%), recreational activities (78\%), and to visit family and friends (94\%).
- Most drive (97\%); we also heard from freight operators (11\%) and active transportation users (9\%).
- $10 \%$ of respondents reported having some form of disability.
- Most identified as White (70\%), and while the survey was not designed to be statistically valid, the demographic characteristics of respondents generally matched those of the study area in general.

Most survey responses and comments revealed that people think traffic back-ups are the biggest challenge and that more lanes and better intersections/interchanges could improve traffic flow. Managed lanes, specifically HOV lanes, were also popular. Regarding active transportation, participant selections highlighted the need for safety improvements like lighting and separation from vehicles. Safety was also a theme when it came to transit improvements, while more frequent service and new routes were also named improvements.

Table 2-4. Online Open House Website Visits

| Metric | English site | Korean site | Spanish site |
| :--- | :---: | :---: | :---: |
| Unique visitors | 3,832 | 22 | 28 |
| Total site views | 5,111 | 31 | 30 |
| Average time on each page (minutes) | $2: 15$ | $0: 14$ | $1: 51$ |

## Chapter 3 Transportation Performance Gaps

This chapter documents the existing and future Baseline conditions on SR 512 between the I-5/SR 512 interchange vicinity in Lakewood, Washington, and the SR 167/SR 512 interchange vicinity in Puyallup, Washington. The SR 512 corridor experiences peak period congestion in both directions and in several locations within the corridor and will continue to do so without additional attention.

### 3.1 Existing Transportation Facilities

### 3.1.1 Study Roadways

SR 512 is a four to eight lane, east-west route classified as Urban Other Freeway/Expressway and is both a National Highway System (NHS) route and Highway of Statewide Significance (HSS) route. SR 512 connects the cities of Lakewood to the west and Puyallup to the east. SR 512 has four lanes each direction between I-5 and the Steele Street S interchange, and three lanes each direction between the Steele Street S and SR 7 interchanges. Between SR 7 and SR 167, SR 512 has two lanes in each direction, except for an auxiliary truck climbing lane in the westbound direction between the Meridian and 31st Avenue SW interchanges. At the I-5/SR 512 system interchange, all ramp movements are free-flow except for the southbound I-5 to eastbound SR 512 ramp, which is controlled by a signal. The speed limit on SR 512 is 60 mph except at the I-5 interchange, where the speed limit is 45 mph near the signalized intersection with the I-5 southbound off-ramp. Other key roadways in the study corridor are listed in Table 3-1.

Table 3-1. Corridor Streets

| Street | Functional Classification | Lanes | Speed Limit (mph) | Orientation |
| :--- | :--- | :---: | :---: | :---: |
| Steele Street S | Urban Principal Arterial | 5 | 35 | $\mathrm{~N} / \mathrm{S}$ |
| SR 7/Pacific Avenue S | Urban Principal Arterial | 5 | 35 | $\mathrm{~N} / \mathrm{S}$ |
| Portland Avenue E | Urban Minor Arterial | $2-3$ | 35 | $\mathrm{~N} / \mathrm{S}$ |
| Canyon Road E | Urban Principal Arterial | 5 | 35 | $\mathrm{~N} / \mathrm{S}$ |
| 94th Avenue E | Urban Minor Arterial | 4 | 30 | $\mathrm{~N} / \mathrm{S}$ |
| 31st Avenue SW | Urban Minor Arterial | $2-4$ | 35 | $\mathrm{E} / \mathrm{W}$ |
| S Meridian | Urban Principal Arterial | 4 | 30 | $\mathrm{~N} / \mathrm{S}$ |
| 112th Street E | Urban Principal Arterial | 5 | 35 | $\mathrm{E} / \mathrm{W}$ |
| E Pioneer | Urban Minor Arterial | 4 | 34 | $\mathrm{E} / \mathrm{W}$ |

### 3.1.2 Freeway Study Area

The freeway study area is in the northwest region of Pierce County and involves the cities of Lakewood, Tacoma, and Puyallup, and unincorporated Pierce County. The study area along SR 512 is bound between the western terminus at I-5 and the eastern terminus at the SR 167/SR 512 interchange. Portions of I-5 and SR 167 are included in the modelling limits because the congestion experienced at these locations has a direct impact on the traffic demands and operations influencing the SR 512 corridor. Within the study area, the SR 512 mainline and interchanges listed below were analyzed and performance metrics were collected using the Vissim microsimulation analysis tool. Figure 3-1 outlines the freeway modeling influence area.

Figure 3-1. Freeway Vissim Model Area

The freeway study area includes only SR 512 from I-5 to SR 167. Ramps at the following interchanges were analyzed as part of this study:

1. I-5/SR 512/S Tacoma Way
2. SR 512/SR 161/31st Avenue SW
3. $\operatorname{SR~512/Steele~Street~} S$
4. SR 512/94th Avenue E/9th Street SW
5. SR 512/SR 7/Pacific Avenue E
6. SR 512/S Meridian
7. SR 512/Portland Avenue E
8. SR 512/E Pioneer
9. SR 512/Canyon Road E
10. SR 512/SR 167

The Vissim model area was expanded to include the three additional interchanges listed below to better capture congestion, queueing, and weaving operations that influence operations. For the purposes of volume development, origin-destination (O-D) estimation, and to facilitate comparisons, the project team chose to leave them within the influence area of this model.

1. I-5/84th Street
2. I-5/Bridgeport Way
3. SR 167/SR 410 Interchange

The Vissim model is intended to analyze freeway mainline and ramp operations only for the 6-hour AM and PM time periods, which are 5-11 a.m. and 2-8 p.m. Ramp terminal intersections on SR 512 that
are anticipated to be affected by the study were modeled in Synchro/Simtraffic for both the AM and PM peak hours, as discussed below.

### 3.1.3 Intersection Study Area

Thirty-seven ramp terminal and arterial intersections have been identified for the study and are listed in Table 3-2 and displayed in Figure 3-2 and Figure 3-3. These intersections are either ramp terminals at the interchange or are within the vicinity and could experience a change in operations within this study and were chosen with WSDOT direction and local stakeholder coordination.

Table 3-2. SR 512 Corridor Study intersections

| ID | Intersection | Jurisdiction | Control Type |
| :---: | :---: | :---: | :---: |
| 1 | Southbound I-5 Off-ramp/SR 512 | WSDOT | Signal |
| 2 | SR 512/S Tacoma Way | WSDOT | Signal |
| 3 | 100th Street SW/S Tacoma Way | City/County | Signal |
| 4 | Pacific Hwy SW/S Tacoma Way | City/County | Signal |
| 5 | Eastbound SR 512/Steele Street S | WSDOT | Signal |
| 6 | Westbound SR 512/Steele Street S | WSDOT | Signal |
| 7 | Sales Road South/Steele Street S | City/County | Signal |
| 8 | 109th Street South/Steele Street S | City/County | Stop |
| 9 | 112th Street South/Steele Street S | City/County | Signal |
| 10 | 112th Street S/SR 7 | WSDOT | Signal |
| 11 | Eastbound SR 512 Ramps/SR 7 | WSDOT | Signal |
| 12 | 108th Street S/SR 7 | WSDOT | Signal |
| 13 | 108th Street E/Westbound SR 512 Off-ramp | WSDOT | Stop |
| 14 | 112th Street E/A Street S | City/County | Signal |
| 15 | 112th Street E/C Street S | City/County | Signal |
| 16 | 112th Street E/Portland Avenue E | City/County | Signal |
| 17 | Eastbound SR 512 Ramps/Portland Avenue E | WSDOT | Signal |
| 18 | Westbound SR 512 Ramps/Portland Avenue E | WSDOT | Signal |
| 19 | 104th Street E/Portland Avenue E | City/County | Signal |
| 20 | 112th Street E/Canyon Road E | City/County | Signal |
| 21 | Eastbound SR 512 Ramps/Canyon Road E | WSDOT | Signal |
| 22 | Westbound SR 512 Ramps/Canyon Road E | WSDOT | Signal |
| 23 | 104th Street E/Canyon Road E | City/County | Signal |
| 24 | 39th Avenue SW/94th Avenue E | City/County | Signal |
| 25 | SR 512 Eastbound Off-ramp/94th Avenue E | WSDOT | Signal |
| 26 | SR 512 Westbound On-ramp/94th Avenue E | WSDOT | Signal |
| 27 | 31st Avenue SW/9th Street SW/94th Avenue E | City/County | Signal |
| 28 | 31st Avenue SW/Westbound SR 512 Ramps | WSDOT | Signal |
| 29 | 31st Avenue SW/Eastbound SR 512 Ramps | WSDOT | Signal |
| 30 | 31st Avenue SW/South Meridian | WSDOT | Signal |
| 31 | Eastbound SR 512 Ramps/South Meridian | WSDOT | Signal |
| 32 | Westbound SR 512 Ramps/South Meridian | WSDOT | Signal |
| 33 | Summit Country Center/Canyon Road E | City/County | Signal |
| 34 | South Hill Park and Ride/94th Avenue E | City/County | Signal |
| 35 | 31st Avenue SW/South Hill Park and Ride | City/County | Stop |
| 36 | 31st Avenue SW/South Hill Park Drive | City/County | Stop |
| 37 | 15th Avenue SW/South Meridian | City/County | Signal |

Figure 3-2. Study Intersections - I-5 to Portland Avenue E

Figure 3-3. Study Intersections - Canyon Road E to S. Meridian

All study intersections were included in the AM and PM peak hour Synchro/Simtraffic model. Queues at the off-ramp terminals were modeled with the Simtraffic simulation model. East Pioneer intersections are not included as a part of this study because East Pioneer was analyzed as a part of previous studies of SR 167.

### 3.1.4 Bus Transit Services

Pierce Transit, Sound Transit, and Intercity Transit offer commuter rail and/or bus service near and through the study area. Sound Transit offers connections to destinations including Tacoma and Seattle via Sounder Commuter Rail and express bus service to multiple destinations. Pierce Transit facilitates
regional and local transit trips while Intercity Transit provides express service between Olympia and Lakewood. It should be noted transit services only cross SR 512 and no transit routes currently use the SR 512 freeway. Table 3-3 provides a summary of bus routes that serve the corridor and which study area roadways those services use. Figure 3-4 shows those routes.

Figure 3-4. Transit Service

Table 3-3. Transit Service within Study Area

| Route | Study Area Roadway(s) Used | Transit Agency | Service | Type | Frequency |
| :---: | :--- | :---: | :---: | :---: | :---: |
| 1 | Pacific Ave S (SR 7) | Pierce Transit | All Days | Daily | 30 minutes |
| 3 | S Tacoma Way | Pierce Transit | All Days | Daily | 30 minutes |
| 4 | 112th St from S Tacoma Way to <br> $94 t h ~ A v e ~ E ~$ | Pierce Transit | All Days | Daily | 30 minutes |
| 45 | Park Ave S/C St S | Pierce Transit | All Days | Daily | 30 minutes |
| 400 | 94th Ave E/31st Ave SW | Pierce Transit | Weekday | Peak | 30 minutes |
| 402 | S Meridian | Pierce Transit | All Days | Peak | 1 hour |
| 425 | 94 th Ave E/31st Ave SW; S <br> Meridian | Pierce Transit | Weekday <br> and Saturday | Peak | 6 runs |
| 574 | SR 512/S Tacoma Way | Sound Transit | All Days | Daily | 30 minutes |
| 580 | 9th Ave E from 31st Ave SW to <br> Puyallup Station | Sound Transit | Weekday | Peak | 3 runs |
| 592 | SR 512/S Tacoma Way | Sound Transit | Weekday | Peak | 30 minutes |
| 594 | SR 512/S Tacoma Way | Sound Transit | All Days | Daily | 30 minutes |
| $6201 T$ | Olympia/512 P\&R Express | Intercity Transit | All Days | Daily | 1 hour |

The I-5/SR 512 Park and Ride facility off South Tacoma Way serves multiple transit agencies and serves as a hub for local and regional transit service within the region. There are two commuter rail lots near the corridor: Lakewood Station and Puyallup Station. The South Hill Mall Transit Center Park and Ride facility at the South Hill Mall offer connection to lines not within the study area.

### 3.1.5 Freight

Freight mobility within the study area is supported by a system of designated freight routes connecting streets to major freight designations. WSDOT uses the Freight and Goods Transportation System (FGTS) to classify roadways based on freight tonnage. Corridors are classified into categories, T-1 through T-5, based on annual tonnage. Those that carry greater than 10 million tons of freight per year are designated as T-1 corridors.

Freight corridors are highlighted in Figure 3-5. SR 512 is a major carrier of freight traffic within the study area, carrying 30.85 million tons in 2019 and is designated as a T-1 corridor. Approximately 7.8 percent of all vehicles are trucks on SR 512. Other roadways in the study area that carry a T-1 designation are I-5, SR 167, and the portion of Canyon Road E from SR 512 to 192nd Street E (nearly 25 million tons in 2019). All other roadways that have interchanges along SR 512, aside from South Meridian and E Pioneer, are also considered freight corridors and have a designation of T-2, indicating 4 to 10 million tons of freight in 2019.

Figure 3-5. Freight Operations

### 3.1.6 Active Transportation Facilities

The study area has both pedestrian and bicycle facilities at interchanges, overpasses, and underpasses. The evaluation of sidewalks and bicycle lanes was limited to these crossing locations and are listed in Appendix A.

SR 512 can serve as a barrier to communities, schools, and key regional destinations on either side of the facility due to limited crossing opportunities at interchanges and cross streets. Many of these facilities have limited or no sidewalks or bicycle lanes and create an uninviting environment for active transportation modes. Connections across the corridor are also limited, in particular in the middle of the corridor near Canyon Road where the spacing between cross streets can exceed a mile. Barriers suppress active transportation because convenient, comfortable, and direct pedestrian and bicycle facilities are limited. More information about these SR 512 crossings is provided later in this chapter.

### 3.1.7 Maintenance

The corridor experiences maintenance challenges and performance gaps including:

- At least once per week, there is a vehicular crash involving the median cable on SR 512 which requires hours to repair. Replacing the cable barrier with a concrete barrier could reduce repair time, allowing traffic flow to return to normal more quickly.
- Existing grass median areas require debris removal, posing safety concerns for maintenance crews performing this work next to the highway.
- Access has been lost to an existing pond in the vicinity of the north side of the 94th Avenue interchange, preventing it from being maintained.
- Another median crossover west of 94th Avenue, which was suggested by the Washington State Patrol at the beginning of this study, would facilitate easier access for maintenance activities.
- Overall, WSDOT Maintenance is concerned about the difficulty in responding to emergency situations.

### 3.2 Existing Data

The existing year, serving as a basis of analysis, is 2019. The year 2019 represents traffic conditions prior to the COVID-19 pandemic and historically had the highest traffic volumes. Any recent traffic counts collected during COVID-19 pandemic conditions between March 2020 and October 2022 were factored to 2019 pre-COVID-19 pandemic conditions based on historic counts, volume trends from permanent traffic recorders (PTRs) on SR 512, aggregated mobile-device location data (referred to as cell phone data for this study), and/or other supplemental data sources.

### 3.2.1 Data Sources

## Freeways and Intersections

All traffic data for the traffic operational analysis was provided by WSDOT, Pierce County, the City of Puyallup, and the City of Lakewood. Data not available from these sources was collected in 2022.

Freeway traffic counts from WSDOT Olympic Region tube counts and/or compact-disc data recovery (CDR) system loop detector data was used to develop existing freeway mainline and ramp volumes on SR 512, SR 167, and I-5 for all mainline and ramps within the study area. When data was unavailable or erroneous, data was used from other sources or cell phone data with calibrated volume estimation tools was applied to known field volumes.

Intersection turning movement counts were collected, compiled, and summarized for the AM and PM peak hours. Older counts were factored to pre-COVID-19 pandemic conditions using growth factors specific to the year of each source data set.

Congestion contour plots from cell phone data were created to calibrate/validate the AM and PM peak period Vissim freeway models. These contour plots were created for both directions of SR 512 between the I-5/SR 512 and SR 167/SR 512 interchanges and are provided in Appendix B.

## Time Periods

The AM and PM periods were analyzed for this assessment study. This Vissim model has 6-hour AM and PM periods ( 5 to 11 a.m. and 2 to 8 p.m.). The intersection analysis focused only on the 1-hour AM ( 7 to 8 a.m.) and PM ( 4 to 5 p.m.) peak hours, as these periods represent conditions with the highest volumes and queues at ramp terminal intersections.

### 3.2.2 Traffic Volumes

## Daily

The existing average weekday traffic (AWDT) volumes were compiled from available data from WSDOT in 2019 (WSDOT Traffic Geoportal, https://www.wsdot.wa.gov/data/tools/geoportal/?config=traffic).

SR 512 has the highest volumes of any east-west road within the study area, with approximately 112,000 vehicles per day (vpd) just east of I-5. At the east end of the study area near SR 167, SR 512 carries approximately 98,000 vpd. Daily traffic volumes are lowest inside of the Canyon Road interchange, with approximately 64,000 vpd.
Peak Period
Existing conditions peak period traffic volumes were compiled and averaged for the peak 3-hour AM period (6 a.m. to 9 a.m.) and PM period (3:30 p.m. to 6:30 p.m.). Most notably, eastbound SR 512 carries between 2,000 and 4,100 vehicles per hour in the AM peak and between 2,400 and 4,400 vehicles per hour during the PM peak. Average traffic volumes on all study segments are presented graphically in Appendix C.

### 3.3 Freeway Operations Analysis

### 3.3.1 Methodology

Vissim, a traffic modeling software, was used for the freeway analysis. The Vissim model replicates the weekday AM and PM commute periods, including the buildup and dissipation of congestion using a 6hour period in the AM period (5 a.m. to 11 a.m.) and PM period ( 2 p.m. to 8 p.m.).

The Vissim model developed from the I-5/SR 512 Interchange Project used validation criteria and accepted tolerances from the Guidelines for Applying Traffic Microsimulation Modeling Software, Vol. 3 (FWHA July 2004) and Protocol for VISSIM Simulation (WSDOT September 2014). While this model was previously calibrated to confirm that it can replicate field conditions, the calibration for this study was enhanced with additional focus on the eastern portion of the study area to better capture traffic interactions with SR 167.

## Analysis Measures

The following measures of effectiveness (MOEs) are reported for freeway operations:

- Vehicle throughput in vehicles per hour (vph)
- Travel time in minutes
- Speed in miles per hour (mph)
- Duration of congestion

Vehicle throughput and travel time was reported for a 3-hour period (6 a.m. to 9 a.m. in the AM period and 3:30 p.m. to 6:30 p.m. in the PM period). The 3-hour period represents the period with the most congestion in the study area. Speed and duration of congestion are reported for the entire 6-hour reporting period ( 5 a.m. to 11 a.m. in the AM period and 2 p.m. to 8 p.m. in the PM period) with temporal speed charts or heat maps. The heat maps report the average speed across all lanes at 15minute intervals and 0.2-mile spacing along the entire freeway study area.

### 3.3.2 Operations, Speeds, and Congestion

Heat maps showing 2019 Existing Conditions AM and PM peak period freeway speeds and congestion in the study area are provided for SR 512 in Figure 3-6 and Figure 3-7.

Figure 3-6. 2019 AM Period Existing Conditions SR 512 Heat Maps

## AM Peak Period

There are two major bottlenecks during the AM peak period on westbound SR 512. The first location is approaching the Canyon Road interchange, where high volume exiting and queuing back to the end of the ramp causes congestion on SR 512. The congestion occurs between 6:30 a.m. and 7:30 a.m. The second bottleneck on westbound SR 512 occurs at the I-5 interchange, where high volume is exiting to northbound and southbound I-5 utilizing only the outside lanes. The congestion occurs from 6:30 a.m. until 8:30 a.m. and spills back to SR 7. The signal at SR 512 and southbound I-5 offramp terminal also causes congestion for the heavy volumes lined up for both southbound and northbound I-5 ramps.

Eastbound SR 512 experiences congestion in the eastern end of the study area, caused by a combination of spillback from congestion on SR 167 outside of the study area and congestion related to the 31st Avenue S and S Meridian interchanges. Eastbound SR 512 also experiences slowdowns near
the Steele Street interchange due to the short weaving distance between the on-ramp from northbound I-5 and the Steele Street off-ramp.

Figure 3-7. 2019 PM Period Existing Conditions SR 512 Heat Maps

## PM Peak Period

There are two major bottlenecks during the PM peak period on westbound SR 512. The first location is approaching the Pioneer Avenue interchange, where high westbound volume on SR 512 causes congestion with the Pioneer Avenue westbound on-ramp. This congestion occurs from 2:30 p.m. until 7 p.m. The second bottleneck on westbound SR 512 occurs at the Canyon Road interchange, where the SR 512 westbound off-ramp terminal at Canyon Road experiences queues that spill back to the westbound SR 512 mainline and vehicles prepositioning to exit at Canyon Road and 31st Avenue SW causes the corridor to experience congestion. This congestion occurs from 3 p.m. until 5 p.m. and spills back to the 31st Avenue SW interchange.

Eastbound SR 512 experiences congestion in the western end of the study area, caused by a combination of spillback from congestion on SR 7 and the short merge from the SR 7 on-ramp. Additional slowing is related to the congestion at the I-5 to Steele Street weave.

### 3.3.3 Travel Times

Freeway travel times were used to assess freeway operations and were determined from the Vissim model. Travel times were measured during the peak 3 -hour AM period ( 6 a.m. to 9 a.m.) and PM period (3:30 p.m. to 6:30 p.m.) for three primary routes described below, results summarized, and shown graphically in Figure 3-8 and in tabular form in Table 3-4:

- Eastbound and westbound SR 512 from Steele Street S to Waller Road S (3.9 miles)
- Eastbound and westbound SR 512 from Waller Road S to Puyallup River Bridge (7.0 miles)
- Eastbound and westbound SR 512 from Steele Street S to Puyallup River Bridge (10.9 miles)

Figure 3-8. 2019 Existing 3-Hour AM and PM Peak Freeway Travel Time Paths and Results

Table 3-4. 2019 Existing 3-Hour AM and PM Peak Freeway Travel Time Paths and Results

| Path | Travel Time Path | Distance (mi) | AM EB | AM WB | AM EB | PM EB |
| :---: | :--- | ---: | ---: | ---: | ---: | ---: |
| $\mathbf{1}$ | Steele St S to Waller Road S | 3.94 | 4.1 | 7.8 | 7.3 | 10.4 |
| $\mathbf{2}$ | Waller Road S to Puyallup River <br> Bridge | 6.99 | 13.2 | 6.4 | 7.4 | 4.1 |
| $\mathbf{3}$ | Steele St S to Puyallup River <br> Bridge | 10.93 | 17.3 | 14.2 | 14.7 | 14.5 |

## AM Period

Drivers on travel time path 1 experience near free flow conditions because there is little to no congestion along this path during the AM period in the eastbound direction. However, the westbound direction for this path experiences delay from Steele Street to the SR 512 to I-5 northbound ramp. This congestion spills back to this path and affects operations upstream as far as SR 7. Along travel time path 2 in the eastbound direction, drivers experience delays between Canyon Road and the end of the study area at SR 167. The congestion outside of the study area along SR 167 queues to the SR 512 corridor which can influence the severity of congestion between 94th Avenue and Pioneer. The westbound direction experiences near free flow conditions because there is little to no congestion along this path during the AM period except for the heavy diverge that occurs at Canyon Road.

## PM Period

Drivers on travel time path 1 in the eastbound direction experience congestion due to the movements to and from SR 7 and the merging operations from Steele Street. For the westbound direction, drivers on this travel path experience near free flow conditions. For travel time path 2, the eastbound direction experiences near free flow conditions because there is little to no congestion. However, the westbound direction experiences heavy congestion and delays from the heavy merge of the SR 167 and SR 512 interchange and the Pioneer Avenue merge. The operations at Canyon Road E create congestion that affects the upstream roadways as far back as the 94th Avenue/31st Avenue interchange area.

### 3.3.4 Freight Operations

The Federal Highway Administration's (FHWA) online Workbook Bottleneck tool was used to analyze freight volumes, delay, emissions, and congestion costs. The tool shows the study corridor in three segments, with values for each travel direction. Data for 2019 is shown in Figure 3-9 and Table 3-5.

Figure 3-9. 2019 Freight Traffic

Source: Workbook: FHWA FMM Bottlenecks 5.1, accessed May, 2023.

Table 3-5. Freight Traffic

| Corridor Section | Length <br> $(\mathrm{mi})$ | AADT <br> (Trucks) | Delay <br> $(\mathrm{mi})$ | Delayl <br> Mile | CO2/ <br> Mile | Congestion <br> Cost |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| 1. Eastbound | 2.6 | 3,096 | 23,238 | 8,912 | 16 mt | $\$ 1.3 \mathrm{M}$ |
| 1. Westbound | 2.6 | 3,082 | 19,498 | 7,586 | 16 mt | $\$ 1.1 \mathrm{M}$ |
| 2. Eastbound | 6.6 | 2,822 | 27,889 | 4,212 | 14 mt | $\$ 1.6 \mathrm{M}$ |
| 2. Westbound | 6.7 | 2,828 | 22,177 | 3,323 | 14 mt | $\$ 1.3 \mathrm{M}$ |
| 3. Eastbound | 2.6 | 3,254 | 15,263 | 5,971 | 16 mt | $\$ 0.9 \mathrm{M}$ |
| 3. Westbound | 2.6 | 3,254 | 11,481 | 4,509 | 16 mt | $\$ 0.6 \mathrm{M}$ |

Source: Workbook: FHWA FMM Bottlenecks 5.1, accessed May, 2023.
Eastbound traffic for each segment shows significantly more delay than westbound traffic. Segment 1 between I-5 and D St E has higher levels of delay per mile than the other segments.

### 3.4 Intersection Operations Analysis

### 3.4.1 Methodology

Intersection operations analysis used the Synchro/Simtraffic (version 11.1.1.6) software package to calculate signalized intersection delay and level of service (LOS) and calculate 95th percentile queue lengths. Geometric layouts, volume, and signal timing information from WSDOT was used for this analysis. Intersections were evaluated using the Highway Capacity Manual, Sixth Edition: A Guide for Multimodal Mobility Analysis (HCM) methodologies (TRB 2016). At locations where HCM 6 methodologies are not valid, the HCM 2000 methodology was used, consistent with policy from WSDOT Synchro and Simtraffic Protocol (WSDOT, August 2018). Simtraffic is the microsimulation component of the Synchro software package and was used to calculate 95 th percentile queue results. Simtraffic was run for five random seeds with the results averaged.

## Analysis Measures

The MOEs used for intersection analysis include:

- LOS
- Delay (seconds per vehicle)
- 95th percentile queue lengths

Synchro calculates intersection LOS and average delay, while Simtraffic calculates 95th percentile queue lengths. LOS refers to the degree of congestion measured in average delay per vehicle. LOS A is the best operating condition, with motorists experiencing minimal delays. LOS F is the worst condition, with motorists experiencing extremely high delays, and at signal, often waiting through multiple signal cycles. Table 3-6 shows the LOS and vehicle delay criteria for signalized intersections.

Table 3-6. Intersection LOS Criteria and Descriptions

| LOS | Average Delay (seconds/vehicle | Description |
| :---: | :---: | :--- |
| A | 0 to 10.0 | Little or no delay |
| B | 10.1 to 20 | Short delays |
| C | 20.1 to 35.0 | Moderate delays |
| D | 35.1 to 55.0 | Long delays |
| E | 55.1 to 80.0 | Very long delays |
| F | 80.1 or more | Failure - extreme congestion |

Intersection delays were estimated for the overall intersection for the purpose of assigning LOS grades using the criteria in Table 3-6. The overall delay is a volume-weighted average of the delays on the approach legs that make up the intersection.

### 3.4.2 Level of Service

Existing Conditions AM peak hour intersection LOS results are presented in Figure 3-10. Detailed intersection tables and reports from Synchro are provided in Appendix D.

Figure 3-10. 2019 Existing Conditions AM Peak Hour Intersection LOS

The AM peak has six intersections that operate at LOS E or F, which also may affect the mainline SR 512 traffic flow. During the AM peak hour, six intersections operated at LOS E or F which accounts for 16 percent of the total study area intersections. Three ramp terminal intersections operate at LOS E or F: I-5 and SR 512, SR 7 westbound terminal, and the 31st Avenue SW westbound ramp terminal. Of these three, the 31st Avenue SW interchange has multiple intersections operating at LOS E or F. Existing Conditions PM peak hour intersection LOS results are presented in Figure 3-11.

Figure 3-11. 2019 Existing Conditions PM Peak Hour Intersection LOS

The PM peak hour has significant failures and intersections that operate at LOS E or F, which also may affect the mainline SR 512 traffic flow. During the PM peak hour, fifteen intersections operated at LOS E or F which accounts for 40 percent of the total study area intersections. Seven ramp terminal intersections operate at LOS E or F: I-5 and SR 512, SR 7 westbound terminal, Portland Avenue westbound terminal, both ramp terminals at 94th Avenue E, and both ramp terminals at 31st Avenue SW. Of these seven interchanges, SR 7, Canyon Road E, 94th Avenue E, and 31st Avenue SW have multiple intersections operating at LOS E or F.

### 3.4.3 95th Percentile Queues

Existing Conditions AM and PM peak hour intersection 95th percentile queue results for the intersections with a focus on the interchanges are presented in Appendix E. The 95th percentile queue lengths were generated using SimTraffic.

At the Canyon Road $E$ and 112th Street $E$ intersection, the 95th percentile queues for all southbound movements in the PM peak hour exceed the storage length, spilling back into the Canyon Road E and Summit Country Center/110th Street E intersection. The spillback causes other southbound through movements 95th percentile queues to also exceed the storage length such as Canyon Road E and eastbound SR 512 Ramps and the Canyon Road E and westbound SR 512 Ramps.

At the eastbound SR 512 and Steele Street S intersection, the 95th percentile queues of all westbound movements exceed the storage length, causing a backup on the loop ramp. The loop ramp queue extends close to SR 512. The 94th Avenue E corridor also exhibits substantial intersection queuing issues in the PM peak hour.

### 3.5 Multimodal Travel Patterns and Activity Levels

Corridor mobility and activity level was assessed using cell phone data from a software as a service platform. This is a type of service that is collected from many anonymized devices - notably smart phones, but also internet-connected vehicles, in-vehicle GPS services, and fleet management systems. The data is collected, blended, and transformed into travel patterns for cars, trucks, and active (pedestrian and bicycle) modes. WSDOT utilized this cell phone data to understand the travel shed of SR 512 users, vehicle and truck travel patterns, and multimodal activity of people adjacent to the SR 512 corridor the study area.

### 3.5.1 Travel Shed

Figure 3-12 shows where most SR 512 corridor users are traveling. The graphic represents approximately 70 percent of all daily weekday travelers that begin on SR 512 and have a destination in the areas shown in blue.

Figure 3-12. Travel Shed of SR 512 Corridor

Most users are destined to the south and east of the corridor with many of these users traveling through interchanges such as Portland Avenue E, Canyon Road E and 94th Avenue E. Fewer trips are destined immediately to the north of the corridor, indicating many people living or working in these communities use other facilities such as I-5 instead of SR 512.

Outside of the immediate corridor, destinations along the east of SR 167 include Kent and Auburn and several of the largest manufacturing and industrial land uses in the region. Other notable destinations include the Port of Tacoma, SeaTac Airport, and along the I-5 corridor to the west of Joint Base Lewis McChord-

### 3.5.2 Origin-Destination Trends

Daily weekday regional travel patterns of SR 512 users were also assessed using cell phone data, available in Appendix F. They were classified based on where their trips begin and end, as follows:

- Internal only: trips that begin and end within the SR 512 corridor
- Internal to/from external: trips that start or end inside the study area, going to or coming from outside the study area.
- External only or pass-through: trips that both begin and end outside the study area.

As shown in Table 3-7, most SR 512 trips have at least one end outside of the study area. This is true for all vehicles and for trucks in particular. Most through trucks on SR 512 use it as a bypass around downtown Tacoma. Considering the size of the study area, this suggests most of the trips along SR 512 are not short or local. It also highlights the importance of SR 512 as a corridor for throughmovement of freight and goods.

Table 3-7. SR 512 Trip Type

| Type of Trip | All <br> Vehicles | Trucks |
| :--- | :---: | :---: |
| Internal Only | $30 \%$ | $10 \%$ |
| Internal to/from External | $53 \%$ | $36 \%$ |
| External Only <br> (Pass through) | $17 \%$ | $54 \%$ |

### 3.5.3 Active Transportation

Active transportation data was collected from March through August 2019 for hexagonal areas within a 1-mile buffer of the SR 512 corridor. Activity was classified into different levels, from negligible through very high, relative to the rest of the study area.

The highest concentrations of walking and bicycle trips in the study area are shown in Figure 3-13 and Figure 3-14, respectively. The greatest proportion of pedestrian activity occurs near retail centers, adjacent to transit hubs, hospitals, schools and universities, and the area surrounding the Washington State Fairgrounds. Many portions of the study area have very low levels of pedestrian activity in the middle of the study area due to lower population density, few desirable walkable destinations, and poor pedestrian facilities.

Figure 3-13. Pedestrian Activity

Figure 3-14. Bicycle Activity

Bicycles also show higher areas of activity along roadways with bicycle facilities, regional trails, and schools. Corridors such as SR 7, 96th Street S and S Meridian have the highest concentrations of bicycles near SR 512.

### 3.6 Existing and Future Active Transportation Performance

Pedestrian crossings of SR 512 were identified in the public involvement process as being generally inadequate and a source of concern with respect to vulnerable road users, including those who use sidewalks for lower-speed cycling and use of mobility assistance devices or smaller transportation aids.

### 3.6.1 Active Transportation Facilities <br> Existing Crossings

Fewer than half of the 22 existing crossings of SR 512 have full sidewalks present. The rest have either sidewalks present for only part of the crossing or no sidewalks present at all. Crossings are shown in Figure 3-15.

Figure 3-15. Existing SR 512 Crossings

### 3.6.2 Existing Conditions for Active System Users

The quality of service provided for active transportation users is described using a four-level system termed Level of Traffic Stress (LTS). LTS is based on the environment experienced by active transportation users and is based on such factors as prevailing speed of adjacent traffic, degree of separation from traffic, and facility width. WSDOT strives to achieve an LTS of 1 or 2 (indicating high performance levels) while LTS values of 3 or 4 indicate that roadway characteristics negatively influence the performance and relative comfort of active transportation users. Pedestrian LTS and Bicycle LTS for existing crossings of SR 512 are indicated in Figure 3-16 and Figure 3-17, respectively.

Figure 3-16. Pedestrian Level of Traffic Stress

Figure 3-17. Bicycle Level of Traffic Stress

### 3.6.3 Distance Between SR 512 Crossings

The significant number of streets, especially north-south ones, cut by the construction of SR 512 has resulted in gaps between crossings that result in substantial out-of-direction travel for both drivers and active users whose trips require a crossing. Some of these active mode users are students. The following gaps between SR 512 crossings are approximately one mile or more:

- Vickery Avenue to Canyon Road E
- Canyon Road E to Woodland Avenue E
- S Fruitland to 94th Avenue E
- 31st Avenue SW to 15th Avenue SW

Several other intervals between crossings of SR 512 are less than a mile but greater than three quarters of a mile.

### 3.6.4 Future Conditions Related to SR 512 as a Local Mobility Barrier

While local plans have some unfunded projects to address individual deficiencies, they are generally spot projects rather than a strategic investment. No new crossings of SR 512 are currently funded, as of the start of this study.

### 3.7 Safety Performance

This study is intended to assess strategies which would improve traffic operations and safety performance along the SR 512 corridor over a near-term and long-term timeframe. This section documents the existing safety analysis for the SR 512 corridor.

The SR 512 study area spans the extent of the SR 512 corridor ( 12 miles) from the South Tacoma Way intersection/l-5 interchange to the SR 167 interchange. In addition to the SR 512 mainline, the study area includes the ramps, ramp terminals, adjacent intersections, and cross street segments between the ramp terminals and adjacent intersections (where applicable).

### 3.7.1 Methodology

The study area was analyzed by facility (mainline, ramp, intersection, and local/cross street). The analysis focused on fatal and severe injury crashes and those involving pedestrians and bicyclists.

The primary analysis period was assumed to be the five-year period from 2015 to 2019. The 2020 and 2021 crash data were also analyzed to examine overall trends, but not included within the primary analysis.

### 3.7.2 Crash History Results

The existing safety analysis focused on the five-year period from 2015 to 2019, which comprised 4,555 total crashes. The study area encompasses the 12-mile corridor along the SR 512 mainline, ramps, 39 study intersections, and cross street segments between the intersections. During the 5 -year analysis period an average of 911 crashes were observed per year.

Table 3-8 highlights the crash types by facility type for the 2015 to 2019 study period. As shown in this table, the most common crash types were rear-end and angle/sideswipe crashes. The rear-end crashes were primarily occurring on either the SR 512 mainline or at study intersections, while the majority of the angle crashes occurred at intersections.

Crash severities were also examined for all crashes within the study area. There was a total of eight fatal crashes and 49 serious injury crashes that occurred. The majority of the fatal crashes occurred on the SR 512 mainline (six), while the others were at study intersection locations. The serious injury crashes were divided amongst the facility types, with the majority occurring at study intersections. A breakdown of crashes by location, type, and time of day is available in Appendix G.

[^0]Table 3-8. Crash Type by Facility Type

| Facility | Rear End | Sideswipe | Fixed Object | Angle/Sideswipe | Other | Total |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Mainline | 1,201 | 313 | 412 | 65 | 130 | $\mathbf{2 , 1 2 1}$ |
| Ramp | 177 | 60 | 137 | 20 | 95 | $\mathbf{4 8 9}$ |
| Local/Cross | 210 | 67 | 27 | 14 | 13 | $\mathbf{3 3 1}$ |
| Intersection | 724 | 102 | 68 | 658 | 62 | $\mathbf{1 , 6 1 4}$ |
| Total | 2,312 | 542 | 644 | 757 | 300 | $\mathbf{4 , 5 5 5}$ |

## SR 512 Mainline Crashes

The SR 512 mainline crashes accounted for 2,121 of the 4,555 crashes ( 46.6 percent of the total study area crashes). Of the six fatal crashes that occurred on the mainline, five were in the eastbound direction and one in the westbound direction. Two thirds of the fatal crashes (four) occurred in 2017. The SR 512 mainline crashes were primarily crashes most often related to congestion (rear-end or same direction sideswipe) or single vehicle, fixed-object crashes.

## Intersection Crashes

The 37 study intersections within the safety analysis area accounted for 1,614 crashes (35.4 percent of total crashes) during the 5 -year analysis period. Two fatal and 17 serious injury crashes occurred. The primary crash types at intersections were rear-end and angle/sideswipe crashes, which are commonly associated with intersections due to the introduction of delay on roadway segments and the potential presence of visual cue challenges.

## Local Roadway Crashes

The local roadway network represents the cross-street connections between the SR 512 mainline, ramps, and intersections within the study area network. These roadway segments accounted for 331 crashes ( 7.3 percent of total crashes). These crashes were primarily rear-end collisions ( 63.4 percent), likely due to congestion and/or access point density along the segments.

## Ramp Crashes

Ramp facilities connect between the SR 512 mainline to intersections and local roadway network. The ramps account for 489 crashes ( 10.7 percent of total crashes) within the study period. Rear-end and fixed-object crashes were the most commonly occurring crash types on ramps through the study network, likely due to congestion and the geometry of the ramps.

## Pedestrian and Bicycle Crashes

There were 25 pedestrian crashes and 6 bicycle crashes during the study period in the study area. The pedestrian crashes consisted of one fatal crash and three serious injury crashes. The fatal pedestrian crash occurred along SR 512 mainline, where pedestrians are prohibited. There were no fatal or serious injury bicycle crashes. Aside from the fatal pedestrian crash, the remainder of the pedestrian and bicycle crashes occurred at intersections or along local street segments. The majority of the pedestrian and bicycle crashes were at the intersections along SR 7. There were seven (six pedestrian, one bicycle) crashes at the SR 7 and 112th Street E intersection and five (four pedestrian, one bicycle) at the SR 7 and 108th Street E intersection.

[^1]
## Crash Clusters

The crash data was analyzed spatially to examine the overall frequency distribution of crashes by location throughout the study area. Figure 3-18 shows the heatmap of all crashes, while Figure 3-19 displays only the fatal and serious injury crashes. The color scales on both heatmaps represent the change in density of crashes from the sparse (green) to dense (red) crashes. The locations with higher crash density include three main junctions on the western end of the SR 512 corridor: South Tacoma Way/l-5, Steele Street, and SR 7, and the South Hill Mall area.
Figure 3-18. Crash Clusters for All Crashes

Figure 3-19. Crash Clusters for Fatal and Serious Injury Crashes

Under 23 U.S. Code § 148 and 23 U.S. Code § 407, safety data, reports, surveys, schedules, and lists compiled or collected for the purpose of identifying, evaluating, or planning the safety enhancement of potential crash sites, hazardous roadway conditions, or railway-highway crossings are not subject to discovery or admitted into evidence in a Federal or State court proceeding or considered for other purposes in any action for damages arising from any occurrence at a location mentioned or addressed in such reports, surveys, schedules, lists, or data.

### 3.8 Future Baseline Travel Demand

Land use and socioeconomic data from the Puget Sound Regional Council's travel demand model was examined for 2050 to establish a travel demand basis for identifying quantitative gaps in transportation network performance. Peak-hour SR 512 vehicle miles traveled (VMT) are forecasted for the 2050 Baseline condition to be approximately 71,000 in the AM peak hour and 81,500 in the PM peak hour. Each of these represents an increase of less than 10\% over estimated existing totals. The relatively limited growth indicates that the freeway operates at or near capacity during the peak hours today, so there is simply not much room for vehicle demand to grow on SR 512.

The study team also examined traffic volume per hour at interchange areas along the freeway. Table 3-9 and Table 3-10 show traffic volume for existing and 2050 Baseline conditions in both peak hours.

Traffic volume forecasts indicate an expectation that by 2050, traffic growth will be modest at most locations, and in a few cases, could even drop slightly as a result of increased congestion. This finding is consistent with the observation that only modest growth is forecast for overall SR 512 VMT.

Table 3-9. AM Existing and 2050 Peak Hour Traffic Volume on SR 512

| Direction | Scenario | Steele | SR 7 | Portland | Canyon | SHM $^{*}$ | Meridian |
| :--- | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Westbound | Existing | 3,700 | 3,118 | 3,199 | 2,257 | 2,271 | 2,319 |
| Westbound | 2050 Baseline | 4,211 | 3,491 | 3,555 | 2,665 | 2,781 | 3,028 |
| Eastbound | Existing | 2,450 | 2,111 | 2,251 | 1,878 | 2,438 | 2,742 |
| Eastbound | 2050 Baseline | 2,455 | 2,081 | 2,221 | 1,847 | 2,262 | 2,549 |

* South Hill Mall

Table 3-10. PM Existing and 2050 Peak Hour Traffic Volume on SR 512

| Direction | Scenario | Steele | SR 7 | Portland | Canyon | SHM* $^{*}$ | Meridian |
| :--- | :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Westbound | Existing | 31,08 | 2,489 | 2,713 | 2,405 | 2,888 | 3,652 |
| Westbound | 2050 Baseline | 3,909 | 3,178 | 3,378 | 3,061 | 3,530 | 4,293 |
| Eastbound | Existing | 3,592 | 2,994 | 3,202 | 2,498 | 2,710 | 2,931 |
| Eastbound | 2050 Baseline | 3,683 | 3,004 | 3,166 | 2,526 | 2,685 | 2,975 |

* South Hill Mall

### 3.9 Future Baseline Operating Conditions

The Baseline condition against which future scenarios are compared contains projects that are not yet complete but are either funded or have a reasonable expectation of being funded by 2050. These projects are shown in Figure 3-20 and listed in Table 3-11.
Figure 3-20. Planned and Programmed Projects

Table 3-11. Planned and Programmed Projects

| Number | Project | Lead |
| :---: | :--- | :---: |
| 1 | SR 167 Gateway | WSDOT |
| 2 | I-5/SR 512 Interchange Replacement (I-5 HOV DDI Recommendation) | WSDOT |
| 3 | Southbound SR 512 Pioneer to Meridian Aux Lane | WSDOT |
| 4 | Southbound Single ETL lane between Ellingson and SR 410 | WSDOT |
| 5 | ETL Direct Access Ramp to SR 167 ETL in Kent | WSDOT |
| 6 | ETL Direct Access Ramp to SR 167 ETL in Auburn | WSDOT |
| 7 | ETL Direct Access Ramp to SR 167 ETL in Sumner | WSDOT |
| 8 | BRT/Enhanced Transit on SR 167 | WSDOT |
| 9 | Missing SR 18 Ramps + Aux Lane Capacity | WSDOT |
| 10 | Complete Valley Ave I/C with SR 167 Extension | WSDOT |
| 11 | Canyon Road Ext. | Partnerships |
| 12 | SR 7 Improvements | WSDOT |
| 13 | SR 161 Improvements | WSDOT |

An auxiliary lane on westbound SR 512 is a Baseline need related to travel demand changes influenced by the SR 167 Completion Project. While the auxiliary lane is currently unapproved, unfunded and unprogrammed, analysis shows that its need and timing are integrally connected to the SR 167 Completion Project.

Future traffic forecasts were analyzed and the resulting operating conditions were simulated to determine the estimated future 2050 Baseline performance. Three measures were used to indicate the quality of future Baseline transportation operations in the study corridor using Vissim: travel time, delay, and intersection LOS. LOS information is provided in a slightly more aggregate form than was previously shown for Existing Conditions. Table 3-12 and Table 3-13 indicate Existing and 2050 Baseline scenario travel time on SR 512.

Table 3-12. AM Existing and 2050 Baseline Freeway Travel Time by Segment (minutes)

| Direction | Scenario | Steele to <br> SR 7 | SR 7 to <br> Portland | Portland <br> to Canyon | Canyon <br> to SHM | SHM* to <br> Meridian | Meridian <br> to Pioneer | Steele to <br> Pioneer |
| :--- | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Westbound | Existing | 2.9 | 1.8 | 3.1 | 2.8 | 2.4 | 1.0 | 14.0 |
| Westbound | 2050 Baseline | 1.9 | 1.7 | 4.0 | 4.8 | 2.8 | 1.0 | 16.1 |
| Eastbound | Existing | 1.8 | 1.7 | 2.7 | 2.7 | 4.2 | 1.7 | 14.8 |
| Eastbound | 2050 Baseline | 1.8 | 1.7 | 5.9 | 10.5 | 11.0 | 3.3 | 34.2 |

* South Hill Mall

Table 3-13. PM Existing and 2050 Baseline Freeway Travel Time by Segment (minutes)

| Direction | Scenario | Steele to <br> SR 7 | SR 7 to <br> Portland | Portland <br> to Canyon | Canyon <br> to SHM | SHM* to <br> Meridian | Meridian <br> to Pioneer | Steele to <br> Pioneer |
| :--- | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Westbound | Existing | 1.8 | 1.7 | 2.7 | 4.0 | 2.5 | 1.6 | 14.3 |
| Westbound | 2050 Baseline | 1.8 | 1.7 | 2.7 | 2.8 | 2.6 | 2.3 | 13.9 |
| Eastbound | Existing | 2.6 | 2.0 | 2.8 | 2.7 | 2.3 | 1.0 | 13.3 |
| Eastbound | 2050 Baseline | 14.0 | 9.3 | 12.1 | 8.7 | 7.0 | 1.7 | 52.7 |

* South Hill Mall

Travel time information indicates that existing bottlenecks are likely to worsen by 2050 if no changes are made in the SR 512 corridor. In some cases, these bottlenecks can have a metering effect, whereby lower speeds and congestion-impacted volumes result in better performance downstream of the bottleneck. An example of this effect is westbound in the morning peak between Steele Street E and Portland Avenue E, and this could be due to mid-corridor increases in congestion, particularly in the Canyon to South Hill Mall segment. Here the 2050 Baseline travel time is forecasted to be lower than the existing condition. In the Eastbound direction travel times could grow in most segments in both peak hours, with the full Steele to Pioneer travel time approximately quadrupling from the Existing condition to the 2050 Baseline.

Peak hour LOS is summarized here for all 37 intersections by interchange area for easier identification of performance gaps. The measure of effectiveness for this comparison and subsequent analysis is the number of intersections that operate at LOS D or better. Table 3-14 and Table 3-15 show Existing and 2050 Baseline intersection LOS by interchange area.

Aggregated intersection LOS results for the PM peak hour are equal to or worse than for the AM peak hour at all six interchange areas examined for this study. The most opportunity to close performance gaps was identified at the SR 7, Canyon Road E, and South Hill Mall interchange areas, where half or fewer of the intersections were shown to meet the general peak hour LOS D standard.

One important finding regarding Baseline conditions is that the SR 512 operations analysis suggests the Diverging Diamond Interchange (DDI) recommended for the I-5/SR 512 interchange in previous study work, and assumed for this planning study, could have difficulty accommodating projected traffic volumes. The version tested here, and included in all future scenarios, was only configured for this SR 512 corridor study; more detailed supplemental analysis is needed to confirm whether a DDI is the appropriate configuration for the I-5/SR 512 interchange.

Table 3-14. AM Existing and 2050 Baseline LOS: \% of Intersections at LOS D or Better

## Chapter 4 Strategy Development and Evaluation

### 4.1 Strategy Development

Initial strategies were developed from three sources that yielded valuable information regarding performance gaps in the study area, including a review of existing plans, input from the community engagement process, stakeholder input, the consultant team, and information from the existing and future Baseline analysis conducted for this project. Only strategies that would clearly address performance gaps were considered. The focus was on Practical Solutions to address near-term and mid-term needs and on detailed analysis results for long-term needs.

Some strategies span the entire 12-mile corridor, while others address a more localized or sub-corridor need. The strategies were organized into five types, although several have elements that could make them multiple strategy types. Strategies were also organized by geography and numbered from west to east, with the first nine in this numerical sequence identified as corridor-wide (C) and the remaining 33 as location-specific (L). The maps in the Executive Summary section of this report identify the locations of these strategies along with implementation recommendations that are described later.

### 4.1.1 Transportation System Management and Operations

Transportation System Management and Operations (TSMO) strategies best represent the WSDOT Practical Solutions goal of "doing the most with the infrastructure we already have." Strategies in this group use minimal new capital investment through simple efforts that upgrade communications, smooth traffic flow, and address lower-level spot needs.

C-1. Corridor-wide fiber optic connectivity for freeway management/information
$\mathrm{C}-2$. Metering of selected on-ramps
C-3. Ramp merge/diverge upgrades
C-4. Median access turnaround(s) for incident management and enforcement
C-5. SR 512 peak-use shoulder lane
L-14. SR 7, SR 512 to 96th Street: Add sidewalks and upgrade intersections
L-39. 5th Street SE Corridor: Signal improvements and lane arrangement changes

### 4.1.2 Active Transportation and Crossings

For active transportation users to access local destinations and/or transit, this type of strategy seeks to address infrastructure shortcomings, such as a lack of crossings on SR 512. Crossing infrastructure investments in particular must be considered in the context of larger-scale programs or projects into which they could be packaged for funding and implementation. WSDOT's Active Transportation Plan has as one of its purposes "to identify gaps in the pedestrian and bicycle network, where a gap is defined as either a physical barrier, or a highway segment that provides for a pedestrian or bicycle Level of Traffic Stress (LTS) 3 or $4 \ldots$. . Identification of such gaps supported by safety performance analysis during project development could lead to more detailed prioritization during implementation planning.

C-6. Sidewalk improvements at existing SR 512 crossings
L-12. Steele Street S, Spanaway Loop Road S to Sales Road S: Add sidewalks
L-17. Portland Avenue E, SR 512 to 72 nd Street E: Add sidewalks
L-18. Portland Avenue E, 112th Street E to SR 512: Add sidewalks and intersection lanes
L-20. New crossing of SR 512 at 46th Avenue E
L-23. New crossing of SR 512 at 59th Avenue E
L-24. Woodland Avenue E, SR 512 to 160th Street E: Add center turn lane, active transportation facilities

L-25. New crossing of SR 512 at 20th Street SW
L-26. Pipeline Trail, 72nd to South Hill Area
L-27. 86th Avenue E, SR 512 to 176th Street E: Add center turn lane, active transportation facilities
L-28. 94th Avenue E, 39th Avenue SW to the north (TBD): Bike lane
L-33. New crossing of SR 512 at 23 rd Avenue SE
L-37. E Pioneer, SR 512 to the west (TBD): Bike boulevard
L-40. Tacoma to Puyallup regional trail along SR 167 extension corridor
L-42. Extend Parkland Community Trail under SR 512
Strategy C-6, a corridor-wide strategy, is intended to capture and represent sidewalk improvement needs at locations not already identified with a location-specific strategy that will also improve or add sidewalks. Locations called out specifically were identified early in the strategy development process as those that would serve areas with more concentrated active transportation use, such as schools, trails, and recreation-oriented areas.

### 4.1.3 Managed Lanes

A managed lane is one that uses vehicle restrictions and/or pricing to limit access with the specific goal of providing a more reliable travel speed than general purpose lanes. With managed lanes planned on I-5 and SR 167, this strategy type addresses how to fill the gap for longer trips in the study corridor and provide a managed-capacity alternative for travelers with destinations within the study area.

C-7. New Managed (high-occupancy vehicle [HOV]/express toll lane [ETL]) lanes on SR 512
L-11. Managed lane direct connection to future I-5 HOV lanes
L-21. Service connection: Mid-corridor direct access point(s) to/from Managed Lane(s)
L-41. Managed lane direct-connect ramps from future SR 167 managed lanes to SR 512

### 4.1.4 Transit

Transit strategies generally focus on regional transit services and access to them. Multiple bus rapid transit (BRT) routes are planned by Pierce Transit across and near SR 512. These potential future routes would benefit from strategies that improve their performance. While no transit routes currently
exist or are planned to operate on the freeway itself, transit providers could reconsider if other strategies such as managed lanes improve potential SR 512 reliability and/or changes in land use and travel patterns increase travel demand along the corridor.

C-8. SR 512 Bus-on-Shoulder program if route(s) moved to SR 512
C-9: Transit access improvements for north-south bus routes
L-10. BRT: Downtown Tacoma to Lakewood Transit Center (TC) via S Tacoma Way
L-30. BRT: Pierce County Airport to South Hill TC and downtown Puyallup via SR 161/Meridian Avenue
L-31. BRT: Lakewood to South Hill TC via 112th Street E

### 4.1.5 Strategic Bottleneck Focus

Location-specific strategies that are capital-intensive were developed to address key vehicle traffic bottlenecks, many of which relate to interchanges and merge areas.

L-13. Interchange at Steele Street: Widen overpass and modify ramps
L-15. Interchange at SR 7/Pacific Avenue S: Widen overpass and modify ramps
L-16. Auxiliary lanes from SR 7 to Portland Avenue E (both directions)
L-19. Interchange at Portland Avenue E: Widen overpass and modify ramps
L-22. Interchange at Canyon Road E: Widen overpass and modify ramps
L-29. Interchange at 94th Avenue E: Widen overpass and modify ramps
L-32. Interchange at 31st Avenue SW: Widen overpass and modify ramps
L-34. Auxiliary lanes from 31st Avenue SW to S Meridian (both directions)
L-35. Interchange at S Meridian: Widen overpass and modify ramps
L-36. Auxiliary lane from S Meridian to E Pioneer (eastbound only)
L-38. Interchange at E Pioneer: Widen overpass and modify ramps

### 4.2 Evaluation Process and Criteria

The evaluation process that was developed identifies the most promising strategies for near-term implementation and groups others that could require longer project development processes or have more prominent implementation barriers into mid- and long-term categories. Travel demand modeling scenarios test the strategies most likely to affect transportation network performance by adding capacity either at the street level or along the SR 512 freeway. Two such modeling scenarios were developed for comparison to the Baseline condition. The 2050 Strategic Bottleneck scenario focuses improvements on the interchanges and does not include any full-length improvements along the SR 512 corridor. The 2050 Managed Lane scenario adds capacity to all of SR 512, with northbound--to--eastbound and westbound-to-southbound direct freeway connector ramps at each end (I-5 and SR 167). This study assumed the managed lanes allow vehicles continuous access along the duration of the SR 512 corridor.

The study team reviewed evaluation criteria with the SAG. Each strategy was evaluated for each criterion to the degree it could provide an improvement over projected future conditions if none of these strategies were implemented (Baseline conditions). Evaluation criteria are described in the following subsections. They are treated equally.

### 4.2.1 Multimodal Mobility and Connectivity

Those using active transportation modes and transit were identified as experiencing a performance gap. Mobility for non-single occupant drivers depends on a robust and connected network of facilities designed and intended for their use. It applies to facilities for both general and recreational use. The analysis of pedestrian and bicycle LTS described in the previous chapter was a prominent factor in the application of this criterion.

### 4.2.2 Safety

Safety performance for all modes and facility types can be improved where crash data revealed clusters of crashes and/or relatively high frequency of severe crashes during the study period. Strategies that would improve safety performance or address congestion that leads to crashes would be expected to perform well according to this criterion.

### 4.2.3 Equity

Those transportation system users who are disproportionately disadvantaged depend more on alternative modes than the general population because they are less likely to have access to a personal vehicle for their travel needs. To that end, strategies that provide more and/or better alternative mode services and improve access to them perform well in terms of equity. This development of this criterion was driven in part by the passage of the HEAL Act in 2021. In its brief on the Act, WSDOT indicates that the Department "has a compelling interest in preventing and addressing environmental effects and health disparities in the state of Washington and ensure all residents have the opportunity to reach their full health and life potential by partnering meaningfully with communities, administering programs to remedy the effects of past disparate treatment of overburdened communities and vulnerable populations, and embed equity and inclusion in mission, planning, goals and measures of progress."

### 4.2.4 Economic Vitality

Individual movement is one measure of economic activity, and, conversely, the more delay the transportation system imposes on its users, the less productive they are. Economic vitality accounts for the overall movement of people in the SR 512 study area and the degree to which they are delayed when they travel. Greater use of regional facilities for regional trips and more intersections operating at LOS D or better are two signs of the better utility enabled by a strategy that would perform well with regard to economic vitality.

### 4.2.5 Resiliency

A resilient transportation system is able to provide more efficient and consistent mobility for the majority of its users. When parts of the system do not function well, it becomes difficult for the system to handle abnormal spikes in delay that might arise due to crashes, recurring congestion, or unforeseen events. Strategies that improve system resiliency are those that increase capacity through potential chokepoints and can function as alternate routes when needed.

### 4.2.6 Freight and Goods Movement

Although the movement of freight and goods is related to economic vitality, it is considered separately here for its importance to specific locations and routes in the SR 512 study area. Road segments and areas that already carry a higher proportion of truck traffic can benefit from strategies that reduce congestion and improve freight mobility.

### 4.2.7 Environment

Prior to strategy identification, a high-level review of environmental constraints within the project corridor was conducted through a desktop review of existing information regarding fish and wildlife habitat, critical areas, water resources, wetlands, and cultural resources. WSDOT also documented an overview of the relevant permits and approvals that would likely be required if the resources noted were to be impacted by a proposed strategy. While this high-level information did not drive the definition of strategies at this planning level, more detailed environmental analysis is likely to be required as implementation work continues.

Most attention on the environment in planning studies focuses on the negative effects that increases in built-area footprint can cause, and that type of approach was considered early in this study. However, focusing on impacts would make this criterion unique because the attention would be on what a strategy does not do rather than on what it does. Instead, the Environment criterion considers primarily the general benefits to air quality and energy use associated with less congestion and more efficient travel. Strategies were not tested for direct quantifiable environmental effects. In particular, transit and active transportation strategies were assumed to have a negligible benefit to the environment in the context of this planning study, given the current and projected heavily suburban character of the SR 512 study corridor.

### 4.2.8 Reliability

The travel reliability criterion was developed to account for strategies that allow the system to handle incidents such as enforcement activity and broken-down vehicles and those that address spot congestion issues that inhibit travel time consistency on a day-to-day basis, for any mode.

### 4.2.9 Practical Solutions/State of Good Repair

The practical solutions concept extends beyond an overarching approach to address corridor needs. Maximizing the use of existing infrastructure and using technology to extend its life are parts of strategies that perform well when measured by this criterion.

### 4.2.10 Implementation and Partnerships

The final criterion for evaluation was developed to differentiate strategies by their potential for implementation and the degree to which partnerships with other agencies would be involved. These partnerships are defined as WSDOT and at least one other public agency working together to implement a strategy or package of strategies. Either could lead the implementation effort, and all parties would be obligated to bring sound planning, funding, and project development expertise to bear.

### 4.3 Evaluation Results

Some criteria used to evaluate strategies were applied qualitatively while others rely on quantitative analysis. Quantitative results are shown here first.

### 4.3.1 Future Travel Demand

Travel demand represents the volume of traffic indicated by the travel demand model. While there is some congestion in both directions at both peak hours, peak direction travel is the focus of the comparisons between strategies. These are westbound in the AM peak hour and eastbound in the PM peak hour. Peak direction SR 512 freeway demand at six key interchange locations for the AM and PM peak hours are shown in Figure 4-1 and Figure 4-2.

Figure 4-1. Westbound AM Peak Hour Demand

Figure 4-2. Eastbound PM Peak Hour Demand

### 4.3.2 Future Operating Conditions

## Freeway

During the AM and PM peak hours, SR 512 shows the worst performance in the 2050 Baseline scenario. The 2050 Bottleneck scenario's arterial-focused improvements tend to show demand shift from the SR 512 corridor to utilize the improved arterials.

In the existing condition, congestion on eastbound SR 167 is known to result in queues that affect SR 512 eastbound traffic. This congestion occurs outside of the study modeling limits but it was accounted for in both the 2019 Existing and 2050 Baseline scenarios. It was assumed this congestion would be relieved as a part of both the 2050 scenarios analyzed for operations: 2050 Strategic Bottleneck Focus and 2050 Managed Lanes.

## Peak Direction Delay

Even though I-5 and SR 167 were not the focus of this study, the peak period congestion occurring on these facilities has a direct impact on the SR 512 corridor. Parts of these facilities were included in the operations model and analyzed to understand the effects of these facilities just beyond the edges of the SR 512 corridor study area. To help describe the impacts associated with I-5 and SR 167, Figure 4-3 and Figure 4-4 show how the overall delays associated with the corridor compare in the peak direction scenarios.

Figure 4-3. Westbound AM Peak Hour Delay

Figure 4-4. Eastbound PM Peak Hour Delay

The aggregate delay information produced from the operations analysis indicated considerable improvement in SR 512 operations in the peak traffic directions (generally westbound in the morning and eastbound in the afternoon) and the effects of I-5 and SR 167 on SR 512.

## Peak Direction Travel Time

Travel Times are presented in Figure 4-5 through Figure 4-6. Travel times are summarized between interchange locations as follows: Steele Street to SR 7, SR 7 to Portland Avenue, Portland Avenue to Canyon Road, Canyon Road to South Hill Mall (94th Avenue and 31st Street), South Hill Mall to S Meridian, and S Meridian to E Pioneer. The 2050 Strategic Bottleneck Focus scenario had no improvements along the SR 512 corridor. As such, the travel times associated with this scenario result in similar results when compared to 2019 Existing and 2050 Baseline in the westbound direction. As mentioned previously, known congestion on SR 167 eastbound has queues affecting the SR 512 corridor in the eastbound direction and this results in increased travel time in the 2050 Baseline Scenario. The 2050 Managed Lane scenario resulted in lower overall travel times even though the demand and throughput increased along the corridor. The dedicated lane operates under capacity, allowing traffic in it to travel faster.

Figure 4-5. Westbound AM Peak Hour Travel Time

Figure 4-6. Eastbound PM Peak Hour Travel Time

## Intersection Level of Service and Queuing

LOS at study area intersections for the AM and PM peak hours are shown in Figure 4-7 and Figure 4-8. The results are summarized in a bar chart that shows the performance as a percentage of intersections meeting the WSDOT LOS performance threshold (LOS D or better). There are four bars of different colors to compare 2019 Existing, 2050 Baseline, 2050 Bottleneck, and 2050 Managed scenario results.

The 95th percentile queuing results at ramp-terminal interchanges were analyzed for the AM and PM peak hours. The queuing metric is the percentage of queues along SR 512 ramp terminals that do not spill back to the mainline during the AM and PM peak hours. The results show queueing impacts to the mainline at ramp terminals in existing conditions, specifically more prominent in the PM peak hour. The results show minimal queueing impacts to the mainline at ramp terminals in future year scenarios due to optimized signal cycles and splits, the SR 167 extension project already implemented, and increased capacity along arterials.

Figure 4-7. Percent of Intersections Meeting LOS Performance Thresholds - AM Peak

Figure 4-8. Percent of Intersections Meeting LOS Performance Thresholds - PM Peak

Peak hour intersection analysis indicates that three interchange areas exhibit more operational challenges than others. The SR 7, Canyon Road, and South Hill Mall areas showed fewer intersections meeting the LOS standard, even after planning-level improvements in the 2050 Strategic Bottleneck Focus scenario are accounted for. The 2050 Managed Lanes scenario does not include interchange
improvements, so there are fewer intersections meeting the LOS standard than with the 2050 Bottleneck Focus scenario, and the the same as in the 2050 Baseline scenario, corridor-wide.

### 4.3.3 Strategy Performance

The evaluation of strategies for each criterion resulted in one of three performance scores, relative to the Baseline condition. The strategy was indicated to have either $(N)$ no effect or a negligible one, $(P)$ a partial or more localized benefit, or (B) a bigger and/or broader benefit. These scores are listed in Table 4-1.

Table 4-1. Strategy Evaluation Scores
Performance relative to Baseline condition: $\mathbf{N}=$ No/negligible benefit; $\mathbf{P}=$ partial or limited benefit; $\mathbf{B}=$ bigger benefit

| Category | Strategy |  |  | 京 |  |  |  |  |  |  |  |

## Transportation System Management and Operations

TSMO strategies feature partial-benefit performance ratings for reliability. Strategy L-14 to address the northern part of the SR 7 interchange area was estimated to perform the best of these strategies in terms of multiple criteria due to the need for upgrades to support the SR 7 BRT project. While the corridor-wide strategies to make spot improvements have not been studied in enough detail to call out specific locations, they are expected to provide substantial benefit, especially in terms of resiliency. Ramp merge and diverge area upgrades are important for their benefits to safety and represent an efficient way to solve a problem with a targeted efficient investment. Strategy L-29 to improve 5th St SE operations is expected to be implemented under City of Puyallup leadership and have only partial benefits to SR 512.

## Active Transportation and Crossings

Most of the specific benefits of strategies in the Active Transportation and Crossings category accrue in the multimodal mobility, safety, and equity criteria. New crossings would also be particularly effective at improving reliability and resiliency by providing more alternate routes across SR 512. All of the strategies in this category would involve some level of partnership with the Cities and/or Pierce County.

## Managed Lanes

Managed lane strategies have the most potential to improve conditions with respect to resiliency and reliability and to provide at least secondary benefits to corridor-wide freight mobility. A mid-corridor direct access to managed lanes has strong potential to both reduce freeway weaving and function as a new crossing of 512 for non-interchange traffic, which could provide secondary benefits to adjoining interchanges by spreading traffic across more routes.

## Transit

The transit strategies recommended here primarily address the future BRT corridors of 112th Street E and S Meridian. While the Downtown Tacoma to Lakewood BRT project is important to the regional transit system and is recommended here, it received lower performance ratings because it does not serve primary transit demand within the SR 512 study area itself. Transit access improvements will provide important first mile/last mile connectivity to those who depend on transit.

## Strategic Bottlenecks

Interchange and auxiliary lane strategies that performed the best in the evaluation were those that exhibited the most Baseline scenario operating issues, as indicated by freeway and intersection analysis documented in Chapter 3. In particular, delays projected at the SR 7, Canyon Road E, and 31st Avenue SW interchanges showed the most responsiveness to planning-level improvements defined by the strategies developed for them. Auxiliary lanes represent a potential expansion of interchange capacity beyond the merge/weave area upgrade strategy included in the TSMO category. All of these strategies would be almost entirely WSDOT's responsibility.

### 4.3.4 Cost Estimates

Planning-level cost estimates were developed for each strategy using the WSDOT Planning Level Cost Estimating Tool. These are broad ranges that reflect the high-level, conceptual nature of this study and will be refined during future phases of strategy development. Cost estimate ranges are shown in Table 4-2 below.

Table 4-2. Cost Estimates

| Number | Strategy Name | Low Cost (\$M) | High Cost (\$M) |
| :---: | :---: | :---: | :---: |
| C-1 | Corridor-wide fiber optic connectivity: improve freeway management \& driver information | \$ 34.9 | \$ 46.6 |
| C-2 | Metering of selected on-ramps | \$ 1.8 | \$ 2.4 |
| C-3 | Ramp merge/diverge upgrades: lengthen to modern standards | \$ 280 | \$ 373 |
| C-4 | Median access/turnaround(s): enforcement \& incident response | \$ 0.6 | \$ 0.8 |
| C-5 | SR 512 Peak Use Shoulder Lane | \$ 5.3 | \$ 7.1 |
| C-6 | Sidewalk improvements at existing SR 512 crossings | \$ 8.0 | \$ 10.7 |
| C-7 | Managed Lane (HOV/ETL) in each direction on SR 512 | \$ 146 | \$ 194 |
| C-8 | SR 512 Bus on Shoulder program, if route(s) moved to SR 512 | \$ 5.3 | \$ 7.1 |
| C-9 | Transit access improvements for north-south bus routes | \$ 11.6 | \$ 15.4 |
| L-10 | BRT: Downtown Tacoma to Lakewood TC via S Tacoma Way | \$ 79.5 | \$ 106 |
| L-11 | Managed Lane direct connection to future I-5 HOV lanes | \$ 133 | \$ 178 |
| L-12 | 116th /Steele - Spanaway Loop to Sales: curb, gutter, sidewalk | \$ 4.3 | \$ 5.8 |
| L-13 | Interchange at Steele Street: Widen overpass \& modify ramps | \$ 37.1 | \$ 49.5 |
| L-14 | SR 7, SR 512 to 96th St minor intersection channelization/widening | \$ 2.6 | \$ 3.5 |
| L-15 | Interchange at SR 7/Pacific Avenue S: Widen overpass \& modify ramps | \$ 43.0 | \$ 57.3 |
| L-16 | Auxiliary lanes from SR 7 to Portland Avenue E (both directions) | \$ 16.4 | \$ 21.9 |
| L-17 | Portland Ave E - SR 512 to 72nd: curb, gutter, sidewalk | \$ 8.84 | \$ 11.8 |
| L-18 | Portland Ave E-112th St E to SR 512: sidewalks, turn lanes, capacity | \$ 5.8 | \$ 7.7 |
| L-19 | Interchange at Portland Avenue S: Widen overpass \& modify ramps | \$ 35.1 | \$ 46.8 |
| L-20 | New crossing of SR 512 at 46th Ave E | \$ 7.0 | \$ 9.3 |
| L-21 | Service connection: mid-corridor direct access to/from Managed Lane | \$ 133 | \$ 178 |
| L-22 | Interchange at Canyon Road E: Widen overpass \& modify ramps | \$ 37.1 | \$ 49.5 |
| L-23 | New crossing of SR 512 at 59th Ave E | \$ 7.0 | \$ 9.3 |
| L-24 | Woodland Ave E - SR 512 to 160 th St E: center turn lane, active transportation upgrades, access management | \$ 39.8 | \$ 53.0 |
| L-25 | New crossing of SR 512 at 20th St SW | \$ 7.0 | \$ 9.3 |
| L-26 | Pipeline Trail - 72nd to South Hill area | \$ 17.0 | \$ 22.7 |
| L-27 | 86th Ave E - SR 512 to 176th St E: turn lanes \& active transportation facilities | \$ 48.2 | \$ 64.3 |
| L-28 | 94th Ave E-39th Ave SW \& north: bike lane | \$ 3.7 | \$ 5.0 |
| L-29 | Interchange at 94th Avenue E: Widen overpass \& modify ramps | \$ 38.9 | \$ 51.9 |

| L-42 | Extend Parkland Community Trail under SR 512 | $\$ 9.2$ | $\$ 12.2$ |

Estimates are in 2023 dollars

### 4.3.5 Supplemental Analysis of the SR 512ISR 167 Interface

WSDOT undertook a focused analysis of peak-period traffic operations on SR 512 in conjunction with potential extension of future SR 167 express toll lanes (ETL) into the SR 512 corridor. This analysis informs future discussions surrounding potential termination points for the SR 167 ETLs in relation to potential managed lane implementation in the SR 512 corridor. However, this supplemental analysis did not directly influence strategy evaluation or phasing for SR 512 recommendations.

The analysis, which appears in Appendix H, suggests that different approaches may be pursued for westbound and eastbound SR 512. For westbound SR 512, the analysis suggests that year 2030 traffic operations would be optimized by extending the SR 167 ETL lanes via a transition lane along SR 512 westbound as far as 31st Avenue SW. For eastbound SR 512, acceptable year 2030 traffic operations can be achieved if the SR 167 ETL lane begins north of the Puyallup River bridge as long as an additional auxiliary lane is provided on eastbound SR 512 between Meridian and Pioneer. The analysis also shows that, by year 2050, the SR 167 ETL transition points would need to be extended further west in the SR 512 corridor to achieve desired operational performance.

## Chapter 5 Corridor Vision and Implementation

The implementation plan advances the recommended strategies most likely to improve multimodal corridor performance. This process resulted in a clear long-term vision for the corridor that will address performance gaps for all users and make SR 512 a more resilient, connected, and sustainable multimodal facility in the region's transportation network.

### 5.1 Elements of the SR 512 Vision

The long-term corridor vision for SR 512 includes the following four components that individually - and collectively - address one or more performance gaps identified during the study process.

Corridor-wide managed lanes form the backbone of the overall SR 512 vision. Managed lanes provide the best opportunity for efficient and measured capacity expansion to serve projected growth, while minimizing impacts associated with traditional highway widening. Managed-lane facilities are already planned to connect corridors at each end of SR 512. These interlinked corridors, with SR 512 at the center, provide an important route option for both regional and local travelers. The other vision components below will contribute to the success of corridor-wide managed lanes.

Addressing strategic bottlenecks at SR 512 interchange ramp terminals and crossings will be a vital step toward the successful realization of the long-term vision. In partnership with local agencies through the South Pierce Multimodal Corridor Study, WSDOT will continue to examine and advance interchange improvement strategies aimed at stabilizing travel times and improving multimodal reliability. These progressive and targeted improvements will ease the chokepoints that plague the corridor now and are expected to worsen over time without action.

Transit facilitation represents an even earlier opportunity for partnerships that address equity concerns with mobility and access to services in the area. Beyond housing and jobs, land uses such as education, medical care, shopping, and recreation, and access to transportation links beyond the corridor can be improved through high-quality public transit.

Active transportation and system management is the foundational element for many of the improvements needed to realize the SR 512 corridor vision. This study identifies several improvements that maximize the use of existing infrastructure through efficient, specialized upgrades. These improvements can solve immediate needs and be expanded upon later with larger-scale projects as funding is identified. Those pressing needs that can be addressed by simpler strategies with lower barriers to implementation were some of the first identified by this study.

### 5.2 Implementation Groups

Assignment of individual strategies into near-, mid-, and long-term time horizons was informed by the existing and future Baseline performance analysis, the scale and likely cost of each strategy, the likely timing of planned transportation projects in adjacent corridors, and a strategy's role in delivering the strategic vision described in Section 5.1. Essentially, the goal was to develop a phased plan that is consistent with the WSDOT Practical Solutions approach of delivering the right project at the right place at the right time.

This grouping process was developed to recognize and highlight the sequential nature of, and interactions between, certain combinations of strategies that will help guide the steps to implement them. Near-term strategies are those that can be implemented in a shorter timeframe to address an
immediate performance gap; in some cases, a near-term strategy will be an initial phase of a larger project. Mid-term strategies begin to address more intractable performance gaps through larger-scale work. Long-term strategies that require careful planning, funding, and coordination complete the picture with more robust upgrades to safe, equitable, and flexible transportation networks and services. The strategy groupings are shown schematically in Figure 5-1 and Figure 5-2 with accompanying Table 5-1 through Table 5-5. They are presented by timeline and category in Table 5-6 through Table 5-10.

The long-term vision for the SR 512 corridor will take shape as more of the strategy pieces come together. It is WSDOT's intent that each recommended strategy will be considered by all interested and affected parties with regard to its contribution to the long-term vision, its relationship with other strategies in SR 512 and adjacent corridors, and the transportation needs of the corridor and the region as they evolve over time.

### 5.3 Lead Roles and Partnerships

The strategies recommended in this planning study represent a mix of those for which implementation would be led by WSDOT and those led by partner agencies with some WSDOT involvement. Partner agencies are those with interest in any prominent facility included in the corridor study area, whether generally or as outlined in WSDOT's City Streets as Part of State Highways Guidelines. Funding for recommended strategies remains to be identified and may be a mix of legislative line-item requests, discretionary grants, and locally-generated revenue. An agency's lead role during strategy development is independent of funding; all partners in the SR 512 Corridor Study have a shared role in identifying and securing project funding.

WSDOT-led strategies are those where changes would be made to facilities owned by WSDOT. Partnership arrangements would be developed for other strategies where facilities are owned or managed by others and where transportation service and/or maintenance would be provided by another agency such as Pierce Transit, the City of Puyallup, or Pierce County. The assignments of these "Lead" designations are subject to change as the strategy development process continues.

## Chapter 6 Conclusion and Next Steps

The SR 512 Corridor Study has been completed to address the needs of the planning phases of WSDOT's Practical Solutions approach with the identification of performance gaps and the development and evaluation of strategies to address them. The strategies developed are consistent with local and regional plans. The information developed for this study was used to demonstrate needs, form strategies for consideration, and evaluate those strategies across a broad range of criteria.

This study documentation will be used to support next steps toward refining strategies, pursuing and justifying funding, and eventual implementation. Based on existing and anticipated future gaps in the transportation network, the SAG worked with the project team to prepare prioritized recommended solutions for the SR 512 corridor.

### 6.1 Moving Forward

WSDOT will work with stakeholders and partners to implement near-term, low-cost strategies and continue to work with stakeholders on the further definition and development of mid-term and long-term strategies in the corridor. The recommended strategies must be incorporated into state, regional, and local plans to position the proposed improvements for future funding and implementation.

The Puget Sound Regional Council is a key partner in moving mobility and access projects forward, and WSDOT will work them and SR 512 study partners to incorporate recommended strategies or combinations of strategies at each stage of PSRC's regional transportation plan update process.

## Appendix A

## Pedestrian and Bicycle Facilities Within Study Area

Figure A-1. Pedestrian and Bicycle Facilities within Study Area

| Corridor | Functional Class | Number of Lanes | Speed Limit | Sidewalks: West Side | Sidewalks: East Side | Bike Lanes: West Side | Bike Lanes: East Side |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| S Tacoma Way/SR 512 | Arterial | 4 to 6 | 35 | Yes | Yes | *None | *None |
| Steele St S | Arterial | 4 | 35 | Partial - Between SR 512 WB ramps and Sales Rd S | Partial - Between SR 512 WB ramps and Sales Rd S | *None | *None |
| Steele St S | Arterial | 4 | 35 | Partial - Between SR 512 WB ramps and Sales Rd S | Partial - Between SR 512 EB ramps and just north of 112th Ave S | *None | *None |
| Pacific Ave S (SR7) | Arterial | 4 | 35 | Partial - One block north of 108th St S | Partial - Around the intersections of 112th St $S$ and both C St S and A St S | *None | *None |
| Pacific Ave S (SR7) | Arterial | 4 | 35 | Partial - Between SR 512 EB ramp and 112th St S | Partial - Around the intersections of 112th St $S$ and both C St $S$ and A St S | *None | *None |
| Pacific Ave S (SR7) | Arterial | 4 | 35 | Partial - South of 112th St S | Partial - Around the intersections of 112th St $S$ and both C St $S$ and A St S | *None | *None |
| Portland Ave E | Minor Arterial | 2 | 35 | Partial - Between EB 512 Ramp and 112th | None | *None | *None |
| Portland Ave E | Minor Arterial | 2 | 35 | None - EB Ramps and 108th | None | *None | *None |
| Canyon RdE | Arterial | 4 to 6 | 35 | Yes | Yes | Partial - EB Ramps to the South | Partial - EB Ramps to the South |
| Canyon RdE | Arterial | 4 to 6 | 35 | Yes | Yes | *None - EB Ramps to the North | *None - EB Ramps to the North |
| 31st Ave SW | Minor Arterial | 2 | 35 | Partial - Between S Hill Park Dr and 9th St SW | Partial - Between S Hill Park Dr and 9th St SW | None | None |
| S Meridian | Primary <br> Arterial | 4 | 30 | Yes | Yes | None | None |
| SR 512 | Limited Access Highway | 4 to 6 | 60 | None | None | None | None |
| **Ainsworth Ave S | Minor Arterial | 2 | 30 | Yes | Yes | None | None |
| **Golden Given Rd E | Minor Arterial | 2 | 30 | None | None | None | None |

| $* * C r o s s i n g ~ b e t w e e n ~ G o l d e n ~$ <br> Given Rd E and Portland <br> Ave E | Pedestrian <br> Bridge | N/A | N/A | Yes | Yes | None |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ${ }^{* *}$ Waller Rd E | Minor Arterial | 2 | 35 | None | None | *None |  |
| ${ }^{* *}$ Vickery Ave E | Minor Arterial | 2 | 35 | None | None | *None |  |
| ${ }^{* *}$ Woodland Ave E | Minor Arterial | 2 | 35 | None | None | None |  |
| ${ }^{* *}$ S Fruitland | Minor Arterial | 2 | 35 | None | None | *None |  |
| ${ }^{* * 15 t h ~ A v e ~ S W ~}$ | Minor Arterial | 2 | 30 | Yes | Yes | None |  |
| ${ }^{* * 7 t h ~ A v e ~ S W ~}$ | Minor Arterial | 2 | 30 | Yes | Yes | None | None |
| ${ }^{* *}$ E Main Ave | Minor Arterial | 2 | 30 | Yes | Yes | *None |  |
| ${ }^{* * B e n s t o n ~ D r ~ E ~}$ | Minor Arterial | 2 | 30 | None | None | None |  |

*Note - Wide shoulders present but not signed as a bicycle lane
${ }^{* *}$ Note - Facilities that cross SR 512 but have no direct access to SR

## Appendix B Vissim Calibration Results

## SR 512 Vissim Temporal Speed Results - AM Period

Figure B-1. AM Peak SR 512 Eastbound-General Purpose Lanes (I-5 to Puyallup River Bridge)

Figure B-2. AM Peak SR 512 Westbound-General Purpose Lanes (l-5 to Puyallup River Bridge)

## I-5 Vissim Validation Results - 2019 Existing AM Peak Period (6:00-9:00 AM)

Table B-1. AM Peak Volume Validation (GEH Criteria)

| Lane Type | Total Links <br> with counts | \# Links that meet <br> criteria | Results | Validation Metric <br> Achieved |
| :---: | :---: | :---: | :---: | :---: |
| Freeway Mainline | 29 | 25 |  |  |
| Ramps | 51 | 51 |  | Yes |
| Total of All Links $=$ | 80 | 76 | $95 \%$ | ( |

Table B-2. AM Peak Volume Validation (FHWA Volume Criteria)

| Lane Type | Total Links <br> with counts | \# Links that meet <br> criteria | Results | Validation Metric <br> Achieved |
| :--- | :---: | :---: | :---: | :---: |
| Freeway Mainline | 29 | 29 |  |  |
| Ramps | 51 | 51 |  | Yes |
| Total of All Links $=$ | 80 | 80 | $100 \%$ | Yes |
|  |  | Difference in sum <br> of all link flows $=$ | $-16 \%$ |  |

Table B-3. FHWA Performance Criteria and Measures

| FHWA Performance Criteria and Measures | Validation Acceptance Target |
| :---: | :---: |
| Individual Link Flows | $>85 \%$ of cases |
| Flow $<700$ veh $/ \mathrm{h}$, Within 100 veh/h | $>85 \%$ of cases |
| 700 veh $/ \mathrm{h}<$ Flow $<2700$ veh $/ \mathrm{h}$, Within $15 \%$ | $>85 \%$ of cases |
| Flow $>2700$ veh/h, Within 400 veh $/ \mathrm{h}$ | Within $5 \%$ |
| Difference in sum of all link flows | $>85 \%$ cases |
| GEH Statistic Value | $<4$ |
| GEH Statistic Value $<5$, for individual link flows |  |
| GEH Statistic Value for Sum of All Link Flows | $>85 \%$ cases |
| Travel Times, Model versus Observed |  |
| Within 15\% (or 1 min, if higher) |  |

Table B-4. Network Travel Time Calibration: 2019 AM Peak 3 Hour - 6:00-9:00 AM (Primary Travel Time Routes for Calibration, SR 512 Eastbound)

| Pathway | Segment | Distance (Miles) | Field Travel Time (Minutes) | VISSIM <br> Travel <br> Time <br> (Minutes ) | Abs Diff (Minutes) | Diff.\% | Within 1 minute? | Validation <br> Metric <br> Achieved? |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{gathered} 512-E B 1- \\ 2 \end{gathered}$ | SR 512 <br> Eastbound Steele St S to Puyallup River Bridge | 10.93 | 17.5 | 17.3 | -0.2 | -1\% | Yes | Yes |
| 512-EB1 | SR 512 <br> Eastbound Steele St S to Waller Rd S | 3.94 | 4.4 | 4.1 | -0.3 | -7\% | Yes | Yes |
| 512-EB2 | SR 512 <br> Eastbound Waller Rd S to Puyallup River Bridge | 6.99 | 13.1 | 13.2 | 0.1 | 1\% | Yes | Yes |

Table B-5. Network Travel Time Calibration: 2019 AM Peak 3 Hour - 6:00-9:00 AM (Secondary Travel Time Routes for Calibration, SR 512 Westbound)

| Pathway | Segment | Distance (Miles) | Field Travel Time (Minutes) | VISSIM <br> Travel <br> Time <br> (Minutes <br> ) | Abs Diff (Minutes) | Diff.\% | Within 1 minute? | Validation <br> Metric <br> Achieved? |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\left\|\begin{array}{c} 512-W B 1- \\ 2 \end{array}\right\|$ | SR 512 <br> Westbound - Puyallup River Bridge to Steele St S | 10.90 | 14.6 | 14.2 | -0.4 | -3\% | Yes | Yes |
| 512-WB1 | SR 512 <br> Westbound - Puyallup River Bridge to Waller Rd S | 6.97 | 9.0 | 7.8 | -1.2 | -13\% | No | Yes |
| 512-WB2 | SR 512 <br> Westbound <br> - Waller Rd <br> S to Steele <br> St S | 3.93 | 5.6 | 6.4 | 0.8 | 14\% | Yes | Yes |

Table B-7. FHWA Performance Criteria and Measures

| FHWA Performance Criteria and Measures | Validation Acceptance Target |
| :---: | :---: |
| Individual link flows | $>85 \%$ of cases |
| Flow $<700$ veh $/ \mathrm{h}$, Within 100 veh/h | $>85 \%$ of cases |
| 700 veh $/ \mathrm{h}$ < Flow $<2700$ veh $/ \mathrm{h}$, Within $15 \%$ | $>85 \%$ of cases |
| Flow $>2700$ veh/h, Within 400 veh $/ \mathrm{h}$ | Within $5 \%$ |
| Difference in sum of all link flows |  |
| GEH Statistic Value | $>85 \%$ cases |
| GEH Statistic Value $<5$, for individual link flows | $<4$ |
| GEH Statistic Value for Sum of All Link Flows |  |
| Travel Times, Model versus Observed | $>85 \%$ cases |
| Within $15 \% ~($ or 1 min, if higher) |  |

Table B-8. FHWA Validation Results-Throughput Volumes-Peak 3 Hour - 6:00-9:00 AM Peak Summary (Individual Link Flows)

| Measure | Value | Pass/Fail |
| ---: | :---: | :---: |
| \# of Freeway Mainline Links with Counts: | 29 |  |
| \# that meet FHWA Volume Criteria: | 29 |  |
| \% that meet FHWA Volume Criteria: | $100 \%$ | Pass |
| \# of Freeway Ramp Links with Counts: | 51 |  |
| \# that meet FHWA Volume Criteria: | 51 |  |
| \% that meet FHWA Volume Criteria: | $100 \%$ | Pass |

Table B-9. FHWA Validation Results-Throughput Volumes-Peak 3 Hour - 6:00-9:00 AM Peak Summary (GEH Statistics Value)

| Measure | Value | Pass/Fail |
| ---: | :---: | :---: |
| \# of Freeway Mainline Links with Counts: | 29 |  |
| \# with GEH <=5: | 25 |  |
| \% with GEH <=5: | $86 \%$ | Pass |
| \# of Freeway Ramp Links with Counts: | 51 |  |
| \# with GEH $<=5:$ | 51 |  |
| $\%$ with GEH $<=5:$ | $100 \%$ | Pass |

## I-5 - Vissim Validation Results with WSDOT VISSIM Protocol Criteria-2019

Existing AM Peak Period (6:00-9:00 AM)
Table B-10. AM Peak Volume Validation (WSDOT VISSIM Protocol Criteria)

| Lane Type | Total Links \# Links that <br> with counts | meet <br> criteria | Results | Validation Metric Achieved |
| :--- | :---: | :---: | :---: | :---: |
| State Facility <br> Segments | 25 | 22 | $88 \%$ |  |
| Entry/Exit Locations | 4 | 2 | $50 \%$ |  |
| Entrance/Exit <br> Ramps | 51 | 49 | $96 \%$ |  |
| Local Road <br> Segments | 0 | 0 | $\mathrm{n} / \mathrm{a}$ |  |
| $85 \%$ of All Links <br> Within Criteria? | 80 | 73 | $91 \%$ | Yes |
|  | Sum of All <br> Segment <br> Flows $=$ | $-16 \%$ | Yes |  |

Table B-11. Network Travel Time Calibration: 2019 AM Peak 3 Hour - 6:00-9:00 AM (Primary Travel Time Routes for Calibration, SR 512 Eastbound)

| Pathway | Segment | Facility Type | Distance <br> (Miles) | Field <br> Travel <br> Time <br> (Minutes) | VISSIM <br> Travel <br> Time <br> (Minutes) | Calibration <br> Abs Diff <br> (Minutes) <br> on Facility <br> Type <br> ( $+/$ Minutes) | Validation <br> Metric <br> Achieved? |  |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 512- <br> EB1-2 | SR 512 Eastbound - <br> Steele St S to Puyallup <br> River Bridge | Free- <br> Flowing | 10.93 | 17.5 | 17.3 | -0.2 | 1.6 | Yes |
| 512- <br> EB1 | SR 512 Eastbound - <br> Steele St S to Waller Rd S | Free- <br> Flowing | 3.94 | 4.4 | 4.1 | -0.3 | 0.3 | No |
| 512- <br> EB2 | SR 512 Eastbound - <br> Waller Rd S to Puyallup <br> River Bridge | Free- <br> Flowing | 6.99 | 13.1 | 13.2 | 0.1 | 1.4 | Yes |

Table B-12. Network Travel Time Calibration: 2019 AM Peak 3 Hour - 6:00-9:00 AM (Secondary Travel Time Routes for Calibration, SR 512 Westbound)

| Pathway | Segment | Facility Type | Distance <br> (Miles) | Field <br> Travel <br> Time <br> (Minutes) | VISSIM <br> Travel <br> Time <br> (Minutes) | Calibration <br> Abs Diff <br> (Minutes) <br> on Facility <br> Type <br> (+- Minutes) | Validation <br> Metric <br> Achieved? |  |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 512- <br> WB1-2 | SR 512 Westbound - <br> Puyallup River Bridge to <br> Steele St S | Free- <br> Flowing | 10.90 | 14.6 | 14.2 | -0.4 | 1.1 | Yes |
| 512- <br> WB1 | SR 512 Westbound - <br> Puyallup River Bridge to <br> Waller Rd S | Free- <br> Flowing | 6.97 | 9.0 | 7.8 | -1.2 | 0.7 | No |
| 512- <br> WB2 | SR 512 Westbound - <br> Waller Rd S to Steele St S | Free- <br> Flowing | 3.93 | 5.6 | 6.4 | 0.8 | 0.5 | No |

Table B-13. GEH Criteria and Targets

| Criteria | Acceptable Targets |
| :---: | :---: |
| GEH <3.0 | All state facility segments within the calibration |
| area |  |$|$| All entry and exit locations within the calibration |
| :---: | :---: |
| area |

Table B-14. Facility Type Equations

| Facility Type | $\Delta=\frac{1}{\frac{1}{\mathrm{t}}-\frac{4.4}{\mathrm{~L}}}$ Free-flowing |
| :---: | :---: |
| Interrupted Flow | $\Delta=\frac{1}{\frac{1}{\mathrm{t}}-\frac{0.1 * 5280 \mathrm{~S}}{3600 \mathrm{~L}}}-\mathrm{t}$ |
| $\Delta=$ Allowable Travel Time Variation ( $+/$-seconds) <br> $\mathrm{t}=$ Real World Travel Time (seconds) <br> $\mathrm{L}=$ Length (feet) <br> $\mathrm{S}=$ Free Flow Speed (mph); Posted Speed may be used for FFS if unknown |  |

## SR 512 Vissim Temporal Speed Results - PM Period

Figure B-3. PM Period SR 512 Eastbound-General Purpose Lanes (I-5 to Puyallup River Bridge)

Figure B-4. PM Peak Westbound General Purpose Lanes (Puyallup River Bridge to I-5)

## I-5 Vissim Validation Results - 2019 Existing PM Peak Period (3:30-6:30 PM)

Table B-17. PM Peak Volume Validation (GEH Criteria)

| Lane Type | Total Links <br> with counts | \# Links that <br> meet criteria | Results | Validation Metric Achieved |
| :--- | :---: | :---: | :---: | :---: |
| Freeway <br> Mainline | 26 | 20 |  |  |
| Ramps | 51 | 51 |  |  |
| Total of All <br> Links = | 77 | 71 | $92 \%$ | Yes |

Table B-18. PM Peak Volume Validation (FHWA Volume Criteria)

| Lane Type | Total Links <br> with counts | \# Links that <br> meet criteria | Results | Validation Metric Achieved |
| :--- | :---: | :---: | :---: | :---: |
| Freeway <br> Mainline | 26 | 22 |  |  |
| Ramps | 51 | 51 |  |  |
| Total of All <br> Links = | 77 | 73 | $95 \%$ | Yes |
|  |  | Difference in <br> sum of all link <br> flows $=$ | $4 \%$ | Yes |

Table B-19. FHWA Performance Criteria and Measures

| FHWA Performance Criteria and Measures | Validation Acceptance Target |
| :--- | :---: |
| Individual link flows | $>85 \%$ of cases |
| Flow $<700$ veh/h, Within $100 \mathrm{veh} / \mathrm{h}$ | $>85 \%$ of cases |
| $700 \mathrm{veh} / \mathrm{h}$ < Flow $<2700$ veh/h, Within $15 \%$ | $>85 \%$ of cases |
| Flow $>2700$ veh/h, Within 400 veh/h | Within $5 \%$ |
| Difference in sum of all link flows | $>85 \%$ cases |
| GEH Statistic Value | $<4$ |
| GEH Statistic Value < 5, for individual link flows |  |
| GEH Statistic Value for Sum of All Link Flows | $>85 \%$ cases |
| Travel Times, Model versus Observed |  |
| Within $15 \%$ (or 1 min, if higher) |  |

Table B-20. Network Travel Time Calibration: 2019 PM Peak 3 Hour - 3:30-6:30 PM (Primary Travel Time Routes for Calibration, SR 512 Eastbound)

| Pathway | Segment | Fistance <br> (Miles) | Field <br> Travel <br> Time <br> (Minutes) | VISSIM <br> Travel <br> Time <br> (Minutes) | Abs Diff <br> (Minutes) | Diff.\% | Within 1 <br> minute? | Validation <br> Metric <br> Achieved? |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 512- <br> EB1-2 | SR 512 Eastbound - Steele <br> St S to Puyallup River Bridge | 10.93 | 14.7 | 14.7 | 0.0 | $0 \%$ | Yes | Yes |

## Appendix G Crash Analysis

Under 23 U.S. Code § 148 and 23 U.S. Code § 407, safety data, reports, surveys, schedules, and lists compiled or collected for the purpose of identifying, evaluating, or planning the safety enhancement of potential crash sites, hazardous roadway conditions, or railway-highway crossings are not subject to discovery or admitted into evidence in a Federal or State court proceeding or considered for other purposes in any action for damages arising from any occurrence at a location mentioned or addressed in such reports, surveys, schedules, lists, or data.

## Appendix H

## Operations Analysis Supplemental Express Toll Lane

## Technical Memorandum

Date: June 23, 2023
Project: SR 512 Corridor Study
To: WSDOT Olympic Region
From: Shaun Bready; Nate Larson, PE, PTOE; Supplemental Express
Subject: Toll Lane Operations Analysis

### 1.0 Introduction and Improvement Scenario

The State Route (SR) 512 Corridor Study was conducted to identify and evaluate strategies on SR 512 between the I-5/SR 512 interchange vicinity in Lakewood, Washington, and the SR 167/SR 512 interchange vicinity in Puyallup, Washington. The SR 512 corridor experiences peak period congestion in both directions and in several locations within the corridor. As part of the Study, WSDOT has focused on the eastern end of this corridor to be evaluated with consideration of express toll lane (ETL) connections to the SR 167 corridor. This analysis is intended to assess ETL configurations, which would improve traffic operations and safety performance along the SR 512 corridor over a near-term and long-term timeframe. The overall Study vicinity and supplemental focused study area are shown in Figure $\mathrm{H}-1$.

Figure H-1. Study Vicinity and ETL Focused Study Area

### 2.0 Analysis Elements

### 2.1 Analysis Years

The supplemental ETL focus modeled two scenario years using a variety of analytical tools: a nearterm year 2030, and a long-term year 2050.

Freeway, intersection operations, and the Travel Demand Model (TDM) were used to assess projects in both the near- and long-term years.

### 2.2 Time Periods

The AM and PM periods were analyzed for this assessment study. Considerations to the entire 6-hour AM and PM periods (5:00-11:00 a.m. and 2:00-8:00 p.m.) were analyzed; however, for reporting purposes the peak-hour volume period occurring between 7:00 and 8:00 a.m. and 4:00 through 5:00 p.m. was the primary focus This Study utilized a pre-developed Vissim freeway model based on the SR 512 Corridor Study. The intersection analysis focused only on the peak-hour AM and PM for intersections east of Woodland.

### 2.3 Future Year Scenarios

For the near-term year 2030 and long-term year 2050 Build models, six scenarios were analyzed using Vissim and Synchro. Each of these scenarios included all the projects from the 2030 and 2050 Baseline model. The modeled scenarios were assessed with respect to multimodal impacts and benefits relative to the Baseline conditions. Model assumptions and descriptions of each scenario are summarized in below in Table H-1.

Table H-1. Future Year Model Assumptions

| Project/Capacity Elements | Corridor | $\begin{gathered} \text { A } \\ (2030) \end{gathered}$ | $\begin{gathered} \text { B } \\ (2030) \end{gathered}$ | $\begin{gathered} C \\ (2030) \end{gathered}$ | $\begin{gathered} D \\ (2050) \end{gathered}$ | $\begin{gathered} E \\ (2050) \end{gathered}$ | $\begin{gathered} F \\ (2050) \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| SR 167 Gateway Extension to l-5 | SR 167 Ext. | x | X | X | X | X | X |
| I-5/SR 512 Interchange Improvement (Alt 1-Drop NB I-5 to 512) | SR 512/I-5 | x | X | x |  |  |  |
| I-5/SR 512 Interchange Improvement (DDI) | SR 512/I-5 |  |  |  | X | X | X |
| West/Eastbound SR 512 E Pioneer to S Meridian Aux Lane | SR 512 | x | x | x | x | x | x |
| Southbound Single ETL lane between Ellingson and SR 410 | SR 167 | X | X | X | X | X | X |
| BRT/Enhanced Transit on SR 167 | SR 167 | X | X | X | X | X | X |
| ETL Direct Access Ramp to SR 167 ETL in Kent | SR 167 | X | X | X | X | X | X |
| ETL Direct Access Ramp to SR 167 ETL in Auburn | SR 167 | x | X | X | X | X | X |
| Canyon Road Extension | OffCorridor | X | X | X | X | X | X |
| SR 167 ETL Direct Connect touch down north of river: E Pioneer Access, no additional SR 512 capacity across river | SR 512 | X |  |  | X |  |  |
| SR 167 ETL DC flyover touch down west of E Pioneer: S Meridian Access | SR 512 |  | X |  |  | X |  |
| S Meridian Access, but with capacity extension (such as aux lane) to the west to minimize congestion for PM westbound | SR 512 |  |  | X |  |  | X |

Scenarios A and D extend the SR 167 ETL from SR 410 prior to the Puyallup River. An ETL will have a direct connection through the SR 512 interchange. The ETL direct connector allows access to E Pioneer but does not provide any additional lanes of capacity over the Puyallup River.

Scenarios B and E also connect the SR 167 ETL to SR 512. The ETL connection would provide an additional lane of capacity across the Puyallup River and terminate west of the E Pioneer interchange. An ETL direct connection from SR 167 to SR 512 is also assumed. However, it does not provide access to E Pioneer.

Scenarios C and F provide an ETL direct connection from SR 167 to SR 512, which connects to SR 512 at E Pioneer in both directions. The ETL direct connector does not provide access to E Pioneer; however, it does provide access to $S$ Meridian. This ETL connection creates an additional lane of capacity over the Puyallup River. These
scenarios add an auxiliary transition lane of capacity at the terminus of the ETL, in both directions, and continues to 31 st Avenue SW. Figure $\mathrm{H}-2$ shows how these connections may be configured for each of the scenarios described above.

Figure H-2. ETL Connections to SR 512

### 3.0 Study Area Unincorporated and Limits

### 3.1 Freeway Study Area

The freeway analysis area is in the northwest region of Pierce County in Washington State and includes parts of Puyallup and Pierce County. The analysis area along SR 512 is bound between the western terminus at Canyon Road interchange to the east. The system interchanges of SR 167/SR 512 and SR 167/SR 410 were included in the modeling limits because the managed lane connections within these facilities are critical components to the overall system operations. Congestion experienced at these locations may have direct impacts to the traffic demands and operations influencing the SR 512 corridor and should be considered.

Within the freeway analysis area, the SR 512 mainline and interchanges listed below will be analyzed and performance metrics were collected using the Vissim microsimulation analysis tool. Figure H-3 outlines the freeway modeling influence area. The freeway analysis area includes only SR 512 from Canyon Road E to E Pioneer. Ramps at the following SR 512 interchanges will be analyzed as part of this study:

1. Canyon Road E
2. SR 161/31st Avenue SW
3. 94th Avenue E/9th Street SW
4. S Meridian
5. E Pioneer
6. SR 167

The Vissim modeling area is the same as the model developed for the overall corridor study. For purposes of volume development, origin-destination (O-D) estimation, and comparisons, the team chose to maintain the same modeled interchanges within the influence area of this model.

Figure H-3. Freeway - Vissim Modeling Influence Area

The Vissim model was used to analyze freeway mainline and ramp operations only for the 6-hour AM and PM peak periods. Ramp terminal intersections on SR 512 anticipated to be affected by the Study were modeled in Synchro/Simtraffic for the both the AM and PM peak hours, as discussed below. Volume throughput measured from the Vissim freeway model was matched in the Synchro/Simtraffic ramp terminal intersection analysis. In
addition, if any ramp terminal queues were determined to spill back to the freeway mainline, those queues were replicated in the freeway Vissim model.

### 3.2 Intersection Study Area

Eighteen ramp terminal and arterial intersections have been identified for this analysis and are listed in Table $\mathrm{H}-2$ and displayed in Figure $\mathrm{H}-4$. These intersections are either ramp terminals at the interchange or are within the interchange vicinity that could experience a difference in operations across scenarios compared in this supplemental analysis. For consistency, these intersections numbers match the intersection numbers displayed in the Final Report of the SR Corridor Study.

Table H-2. SR 512 Congestion Study intersections

| ID | Intersection |
| :--- | :--- |
| 1 | 112 th Street E/Canyon Road E |
| 2 | Eastbound SR 512 Ramps/Canyon Road |
| 3 | Westbound SR 512 Ramps/Canyon Road E |
| 4 | 104 th Street E/Canyon Road E |
| 5 | 39th Avenue SW/94th Avenue E |
| 6 | SR 512 Eastbound Off-ramp/94th Avenue |
| 7 | SR 512 Westbound On-ramp/94th Avenue E |
| 8 | 31st Avenue SW/9th Street SW/94th Avenue E |
| 9 | 31st Avenue SW/Westbound SR 512 Ramps |
| 10 | 31st Avenue SW/Eastbound SR 512 Ramps |
| 11 | 31st Avenue SW/S Meridian |
| 12 | Eastbound SR 512 Ramps/S Meridian |
| 13 | Westbound SR 512 Ramps/S Meridian |
| 14 | Summit Country Center/Canyon Road E |
| 15 | South Hill Park and Ride/94th Avenue E |
| 16 | 31st Avenue SW/South Hill Park and Ride |
| 17 | 31st Avenue SW/South Hill Park Drive |
| 18 | 15th Avenue SW/S Meridian |

Figure H-4. Study Intersections - Canyon Road E to SR 167

Study intersections were included in the PM peak hour Synchro/SimTraffic model for all scenarios. Study intersections were included in the AM peak hour Synchro/SimTraffic model for Scenario C and Scenario F. Queues at the off-ramp terminals were modeled with the SimTraffic simulation model. If any queues are observed to spill back to the freeway mainline, those queues were matched in the freeway Vissim model. It should be noted that the E Pioneer interchange ramp terminals are not included as a part of this study. The E Pioneer interchange is being studied and analyzed as a part of WSDOT's Gateway Program.

### 4.0 Travel Demand Forecasts

### 4.1 Forecast Development

Travel demand forecasts for this analysis will be based on the Puget Sound Regional Council (PSRC) EMME model output developed by the South Pierce County Connectivity Study. Growth rates for each direction of SR 512, I-5, and SR 167 within the study area were calculated from the South Pierce County Connectivity Study EMME model output between the 2019 Existing year, 2030 near-term year, and 2050 long-term. The travel demand model provided forecasts for the AM and PM peak hours for two horizon years: a 2030 near-term and a 2050 long-term.

### 4.2 Post Processing

Freeways and Ramps
The growth rates within the study area were applied to existing freeway volumes and balancing adjustments were made per National Cooperative Highway Research Program (NCHRP) Report 765 methodologies. This process can be summarized as:

- Collect existing and future peak period demands from travel demand model and calculate both percent and absolute growth with respect to locations between freeway ramps, ramp terminal, and adjacent intersections for the system peak hour, with a target of matching growth along various segments of the corridor
- Apply growths accordingly over the peak hour to best match the travel demand model as appropriate, while still maintaining overall targets.
- Balance volumes between freeway ramps, ramp terminal, and adjacent intersections for the system peak hour as necessary.
- Apply the same growth across the remainder of the 6-hour peak period, with minor temporal adjustments to different hours.
- Generate 2030 and 2050 AM and PM O-D volumes for the 6-hour period.

Figure $\mathrm{H}-5$ through Figure $\mathrm{H}-8$ shows a comparison of the post-processed vehicle demand at the four major analysis-area arterial crossings during the PM Peak Hour for both the SR 512 eastbound and westbound directions.

Figure H-5. 2030 PM and AM Peak Period Eastbound SR 512 Demands

Eastbound SR 512 Demands
by Analysis Year and Interchange - AM Peak Hour

Figure H-6. 2030 PM and AM Peak Period Westbound SR 512 Demands

Westbound SR 512 Demands
by Analysis Year and Interchange - AM Peak Hour

Figure H-7. 2050 PM and AM Peak Period Eastbound SR 512 Demands

Figure H-8. 2050 PM and AM Peak Period Westbound SR 512 Demands

## Intersections

Intersection forecasts also followed NCHRP 765 methodologies. Intersection approach volume growth from the existing and future year TDM models was applied to existing intersection turning movement counts. The turning movement counts were adjusted to generate future year volumes and balanced with adjacent intersections as necessary. As a final post-processing step, ramp volumes were adjusted to match freeway forecasts. The 2030 and 2050 AM and PM peak hour intersection turn movement volumes were generated for the Synchro/SimTraffic analysis.

### 5.0 Traffic Operations Analysis

### 5.1 Future Year 2030 Build Scenarios

Future year 2030 models were developed from the Existing Conditions Vissim model documented in SR 512: I-5 to SR 167 Corridor Study Existing Condition Technical Memorandum. For purposes of this analysis, the PM peak period is being analyzed along the SR 512 corridor for all scenarios. Scenario C will also be analyzed for the AM peak period. For comparative purposes, the 2030 Baseline scenarios were analyzed for both AM and PM peak periods.

## 2030 Scenario A - PM Peak

A heat map comparing 2030 Baseline and 2030 Build Scenario A freeway speeds and congestion in the study area are provided for westbound and eastbound SR 512 in Figure $\mathrm{H}-9$ and Figure $\mathrm{H}-10$ from the Vissim model simulation results.

Figure H-9. 2030 PM and AM Peak Period Westbound SR 512 Demands

## Westbound SR 512

The congestion between S Meridian and 31st Avenue SW remain similar to the Baseline scenario. The ETL direct connection merging with the general-purpose lanes upstream of the SR 167 westbound to SR 512 westbound merge creates significant operational deficiencies, which directly affects congestion on SR 167 beyond the scope of this study area. The impacts to SR 512 are minimal with this option; however, the impacts are significant to SR 167 operations.

Figure H-10. 2030 PM Period Baseline vs Build Scenario A Eastbound SR 512 Heat Maps

## Eastbound SR 512

Eastbound SR 512 has limited to no change in volume between the Baseline scenario and Scenario A. The configuration of the ETL has no relative impact during this peak period. Congestion due to the S Meridian eastbound merge remains consistent or slightly worse in Scenario A due to the reallocated demand to SR 512 corridor from local arterials.

2030 Scenario B - PM Peak
A heat map comparing 2030 Baseline and 2030 Build Scenario B freeway speeds and congestion in the study area are provided for westbound and eastbound SR 512 in Figure $\mathrm{H}-11$ and Figure $\mathrm{H}-12$ from the Vissim model simulation results.

Figure H-11. 2030 PM Period Baseline vs Build Scenario B Westbound SR 512 Heat Maps

## Westbound SR 512

Westbound congestion between 31st Avenue SW and S Meridian would increase with Scenario B due the additional the SR 167 ETL direct connection at E Pioneer. The increase encourages more vehicles to get to the weaves, but Scenario B changes would also attract more vehicles to the off-ramps of both 31st Avenue SW and S Meridian. The ETL ending at E Pioneer allows vehicles adequate distance to weave; however, traffic is now aligned in the innermost lanes, which creates more weaving maneuvers that induces congestion over a longer period. The congestion occurring east of E Pioneer is the SR 167 to SR 512 merge which queuing affects SR 167 beyond SR 410 in the Baseline. This congestion is worse in Scenario B due to the ETLs merging to the general-purpose lane at E Pioneer, causing the downstream weaves to operate over capacity.

Figure H-12. 2030 PM Period Baseline vs Build Scenario B Eastbound SR 512 Heat Maps

## Eastbound SR 512

Eastbound SR 512 has limited to no change in volume between the Baseline scenario and Scenario B. Congestion due to the S Meridian eastbound merge is significantly worsened in Scenario B due to the reallocated demand to SR 512 corridor from local arterials. Traffic destined for the ETL connection must change multiple lanes of traffic to preposition in the innermost lane accessing the ETL.

## 2030 Scenario C - PM Peak

A heat map comparing 2030 Baseline and 2030 Build Scenario C freeway speeds and congestion in the study area are provided for westbound and eastbound SR 512 in Figure $\mathrm{H}-13$ and Figure $\mathrm{H}-14$ from the Vissim model simulation results.

Figure H-13. 2030 PM Period Baseline vs Build Scenario C Westbound SR 512 Heat Maps

## Westbound SR 512

The ETL continues westbound on SR 512 as a transition lane, which improves the weaves between E Pioneer and S Meridian, and S Meridian and 31st Avenue SW. The additional diverge lane to 31st Avenue SW helps reduce congestion needing to position early to exit there. The congestion occurring east of E Pioneer is the SR 167 to SR 512 merge, which queuing affects SR 167 beyond SR 410 in the Baseline. This congestion does not occur in Scenario C due to the ETL being separated as its own lane and transitioning back to general purpose and far as 31st Avenue SW.

Figure H-14. 2030 PM and AM Peak Period Westbound SR 512 Demands

## Eastbound SR 512

The ETL increases SR 512 demand, which increases the need for an auxiliary lane from 31st Avenue SW. This allows ETL traffic to travel free flow until the separated ETL diverge at E Pioneer.

## 2030 Scenario C - AM Peak

A heat map comparing 2030 Baseline and 2030 Build Scenario C freeway speeds and congestion in the study area are provided for westbound and eastbound SR 512 in Figure $\mathrm{H}-15$ and Figure $\mathrm{H}-16$ from the Vissim model simulation results. As noted previously, Scenario C was the only scenario analyzed for the AM Peak Period.

Figure H-15. 2030 AM Period Baseline vs Build Scenario C Westbound SR 512 Heat Maps

## Westbound SR 512

The congestion occurring at the I-5 and SR 512 system interchange is severe and queues as far as the 94th Avenue merge in the Baseline. Once the queue extends beyond this point, the effects on the upstream merges and weaves degrade, causing severe congestion as far as the end of the SR 512 corridor. The forecasted SR 512 demand east of the South Hill Mall interchanges is not expected to increase demand west of the South Hill Mall, which should not increase traffic into the end of this congestion. The increased demand along SR 512 is projected to be destined for S Meridian and 31st Avenue SW with minimal new traffic continue to the west of these interchanges.

Figure H-16. 2030 AM Period Baseline vs Build Scenario C Eastbound SR 512 Heat Maps

## Eastbound SR 512

In both the Baseline scenario and Scenario C, the congestion downstream on SR 167 does not exist due to the SR 167 ETL addition. The minimal congestion present in Scenario C is due to the increase in traffic demand trying to access the ETL. This added traffic is localized and increases the SR 512 onramps from 31st Avenue SW and S Meridian, which causes the S Meridian merge to operate over capacity for a short time during the peak period.

2030 Ramp-Terminal and Arterial Intersection Analysis Results
Figure $\mathrm{H}-17$ shows the percent of intersection meeting Level of Service (LOS) performance thresholds, LOS D or better. This metric is calculated based on the average delay of all movements and approaches. Figure H-17 represents all 2030 Scenarios for the PM Peak hour only. Future traffic demands to/from arterials increase as
capacity is added over the Puyallup River are most prevalent in Scenario C. Signal timing optimization was implemented at all intersections for this analysis, but intersections around the South Hill Mall and along S Meridian cannot operate efficiently with the apparent induced traffic demands and increased vehicle throughput due to the ETLs.

Figure H-17. 2030 PM Peak Hour Percent of Intersections meeting LOS Performance Thresholds (Synchro Results)

Figure H-18 shows the percent of intersection meeting LOS performance thresholds (LOS D or better). This metric is calculated based on the average delay of all movements and approaches. Figure $\mathrm{H}-18$ represents only 2030 Baseline and Scenario C for the AM Peak hour. The traffic demands in the AM Peak hour had no significant impact to the ramp-terminal and local intersections.

Figure H-18. 2030 AM Peak Hour Percent of Intersections meeting LOS Performance Thresholds (Synchro Results)

### 6.0 Future Year 2050 Build Scenarios

Future year 2050 models were developed from the Existing Conditions Vissim model documented in SR 512: I-5 to SR 167 Corridor Study Existing Conditions Technical Memorandum. For purposes of this analysis, the PM peak period is being analyzed along the SR 512 corridor for all scenarios.
Scenario F will also be analyzed for the AM peak period. For comparative purposes, the 2050 Baseline scenarios were analyzed for both AM and PM peak periods.

## 2030 Scenario D - PM Peak

A heat map comparing 2050 Baseline and 2050 Build Scenario D freeway speeds and congestion in the study area are provided for westbound and eastbound SR 512 in Figure $\mathrm{H}-19$ and Figure $\mathrm{H}-20$, respectively, from the Vissim model simulation results

Figure H-19. 2050 PM Period Baseline vs Build Scenario D Westbound SR 512 Heat Maps

## Westbound SR 512

Similar to the near-term year 2030 results, the congestion between S Meridian and 31st Avenue SW remain similar to the Baseline scenario. The ETL direct connection merging with the general-purpose lanes upstream of the SR 167 westbound to SR 512 westbound merge creates significant operational deficiencies, which directly affects congestion on SR 167 beyond the scope of this study area. The impacts to SR 512 are minimal with this option; however, the impacts are significant to SR 167 operations. By long-term year 2050, demand projections increase slightly compared to near-term year 2030 which is evident in the increased congestion in the Scenario D heat maps, compared to the Scenario A congestion indicated previously in Figures $\mathrm{H}-9$ and $\mathrm{H}-10$.

Figure H-20. 2050 PM Period Baseline vs Build Scenario D Eastbound SR 512 Heat Maps

## Eastbound SR 512

Unlike near-term year 2030, long-term year 2050 eastbound SR 512 has significant growth in volume in the Baseline scenario. The configuration of the ETL has no relative impact during this peak period. Congestion due to the S Meridian eastbound merge remains consistent or slightly worse in Scenario D as a result of the reallocated demand to SR 512 corridor from local arterials.

2050 Scenario E - PM Peak
A heat map comparing 2050 Baseline and 2050 Build Scenario E freeway speeds and congestion in the study area are provided for westbound and eastbound SR 512 in Figure $\mathrm{H}-21$ and Figure $\mathrm{H}-22$ from the Vissim model simulation results.

Figure H-21. 2050 PM Period Baseline vs Build Scenario E Westbound SR 512 Heat Maps (Vissim Results)

## Westbound SR 512

Westbound congestion between 31st Avenue SW and S Meridian would increase due the additional the SR 167 ETL direct connection at E Pioneer. The latent demand congestion on SR 167 can now bypass the SR 167 to SR 512 merge. This traffic demand allows more vehicles to get to the weaves, but also attracts more vehicles to the off-ramps of both 31st Avenue SW and S Meridian The ETL ending at E Pioneer allows vehicles adequate distance to weave; however, traffic is now aligned in the innermost lanes, which creates more weaving maneuvers that induces congestion over a longer period. The congestion occurring east of E Pioneer is the SR 167 to SR 512 merge, which queuing affects SR 167 beyond SR 410. This congestion is worse in Scenario E due to the ETLs merging to the generalpurpose lane at E Pioneer, causing the downstream weaves to operate over capacity.

Figure H-22. 2050 PM Period Baseline vs Build Scenario E Eastbound SR 512 Heat Maps

## Eastbound SR 512

Unlike near-term year 2030, long-term year 2050 eastbound SR 512 has significant growth in volume in the Baseline scenario. The configuration of the ETL has no relative impact during this peak period. Congestion due to the $S$ Meridian eastbound merge remains consistent or slightly worse in Scenario E due to the reallocated demand to SR 512 corridor from local arterials. Increased operational congestion occurs due to the prepositioning of traffic wanting to use the ETL diverge at E Pioneer.

2050 Scenario F - PM Peak

A heat map comparing 2050 Baseline and 2050 Build Scenario F freeway speeds and congestion in the study area are provided for westbound and eastbound SR 512 in Figure $\mathrm{H}-23$ and Figure $\mathrm{H}-24$ from the Vissim model simulation results.

Figure H-23. 2050 PM Period Baseline vs Build Scenario F Westbound SR 512 Heat Maps

## Westbound SR 512

The ETL continues westbound on SR 512 as a transition lane, which improves the weaves between E Pioneer and S Meridian, and S Meridian and 31st Avenue SW. The additional diverge lane to 31st Avenue SW helps reduce congestion needing to position early to get off at 31st Avenue SW. The congestion occurring east of E Pioneer is the SR 167 to SR 512 merge, where queuing affects SR 167 beyond SR 410. This congestion does not occur in Scenario C due to the ETL being separated as its own lane and transitioning to an auxiliary-lane as far as 31st

Avenue SW. In Scenario F, there is a capacity constraint west of the 94th Avenue merge and the increased demand due to the ETL bottlenecks at this location.

Figure H-24. 2050 PM Period Baseline vs Build Scenario F Eastbound SR 512 Heat Maps

## Eastbound SR 512

The ETL increases SR 512 demand, which increases the need for an auxiliary lane from 31st Avenue SW. This allows ETL traffic to travel free flow until the separated ETL diverge at E Pioneer.

A heat map comparing 2050 Baseline and 2050 Build Scenario F freeway speeds and congestion in the study area are provided for westbound and eastbound SR 512 in Figure $\mathrm{H}-25$ and Figure $\mathrm{H}-26$ from the Vissim model simulation results

Figure H-25. 2050 AM Period Baseline vs Build Scenario F Westbound SR 512 Heat Maps

## Westbound SR 512

Congestion in near-term year 2030 was due to the I-5 and SR 512 interchange ramps not having sufficient capacity to serve peak SR 512 demand. For long-term year 2050, an improvement is made to these ramps that serves all traffic demand exiting SR 512. The congestion occurring along SR 512 is now prevalent at the Canyon Road merge. Scenario F would increase demand in this merge, as well demand at the 94th Avenue two-lane section.

Figure H-26. 2050 AM Period Baseline vs Build Scenario F Eastbound SR 512 Heat Maps

## Eastbound SR 512

In both Baseline scenario and Scenario F, the congestion downstream on SR 167 does not exist due to the SR 167 ETL addition. The minimal congestion present in the Baseline scenario is due to the S Meridian merge; this is improved in Scenario F with ETL traffic utilizing the auxiliary lane prior to the diverge at E Pioneer. Unlike Scenario C, traffic destined for the ETL originates from localized interchanges, and by the year 2050, extends to the west to include other interchange origins, minimizing the demand increases from both 31st Avenue SW and S Meridian.

2050 Ramp-Terminal and Arterial Intersection Analysis Results

Figure $\mathrm{H}-27$ shows the percent of intersection meeting LOS performance thresholds (peak hour LOS D or better). This metric is calculated based on the average delay of all movements and approaches. Figure $\mathrm{H}-27$ represents all 2050 Scenarios for the PM peak hour only. Future traffic demands to/from arterials increase as capacity is added over the Puyallup River bridge2, which is most prevalent in Scenario C. Signal timing optimization was implemented at all studied intersections, but intersections around the South Hill Mall and along S Meridian cannot operate efficiently with the induced traffic demands due to the ETLs.

Figure H-27. 2050 PM Peak Hour Percent of Intersections meeting LOS Performance Thresholds (Synchro Results)

Figure $\mathrm{H}-28$ shows the percent of intersection meeting LOS performance thresholds (LOS D or better). This metric is calculated based on the average delay of all movements and approaches. Figure $\mathrm{H}-28$ represents only 2030 Baseline and Scenario C for the AM Peak hour. The traffic demands in the AM Peak hour had no significant impact to the ramp-terminal and local intersections.

Figure H-28. 2030 AM Peak Hour Percent of Intersections meeting LOS Performance Thresholds (Synchro Results)

    * HCM Gth computational engine requires equal clearance fimes for the phases crossing the barrier.

[^6]:    Notes
    Unsignalized Delay for［EBR］is excluded from calcuations of the approach delay and intersection delay．

[^7]:    Notes
    ＊HCM Gh computational engine requires equal clearance fimes for the phases crossing the barrier．

[^8]:    Under 23 U.S. Code § 148 and 23 U.S. Code § 407, safety data, reports, surveys, schedules, and lists compiled or collected for the purpose of identifying, evaluating, or planning the safety enhancement of potential crash sites, hazardous roadway conditions, or railway-highway crossings are not subject to discovery or admitted into evidence in a Federal or State court proceeding or considered for other purposes in any action for damages arising from any occurrence at a location mentioned or addressed in such reports, surveys, schedules, lists, or data.

[^9]:    Under 23 U.S. Code § 148 and 23 U.S. Code $\S 407$, safety data, reports, surveys, schedules, and lists compiled or collected for the purpose of identifying, evaluating, or planning the safety enhancement of potential crash sites, hazardous roadway conditions, or railway-highway crossings are not subject to discovery or admitted into evidence in a Federal or State court proceeding or considered for other purposes in any action for damages arising from any occurrence at a location mentioned or addressed in such reports, surveys, schedules, lists, or data.

[^10]:    Under 23 U.S. Code § 148 and 23 U.S. Code § 407, safety data, reports, surveys, schedules, and lists compiled or collected for the purpose of identifying, evaluating, or planning the safety enhancement of potential crash sites, hazardous roadway conditions, or railway-highway crossings are not subject to discovery or admitted into evidence in a Federal or State court proceeding or considered for other purposes in any action for damages arising from any occurrence at a location mentioned or addressed in such reports, surveys, schedules, lists, or data.

[^11]:    Under 23 U.S. Code § 148 and 23 U.S. Code § 407, safety data, reports, surveys, schedules, and lists compiled or collected for the purpose of identifying, evaluating, or planning the safety enhancement of potential crash sites, hazardous roadway conditions, or railway-highway crossings are not subject to discovery or admitted into evidence in a Federal or State court proceeding or considered for other purposes in any action for damages arising from any occurrence at a location mentioned or addressed in such reports, surveys, schedules, lists, or data.

[^12]:    Under 23 U.S. Code § 148 and 23 U.S. Code § 407, safety data, reports, surveys, schedules, and lists compiled or collected for the purpose of identifying, evaluating, or planning the safety enhancement of potential crash sites, hazardous roadway conditions, or railway-highway crossings are not subject to discovery or admitted into evidence in a Federal or State court proceeding or considered for other purposes in any action for damages arising from any occurrence at a location mentioned or addressed in such reports, surveys, schedules, lists, or data.

[^13]:    Under 23 U.S. Code § 148 and 23 U.S. Code § 407, safety data, reports, surveys, schedules, and lists compiled or collected for the purpose of identifying, evaluating, or planning the safety enhancement of potential crash sites, hazardous roadway conditions, or railway-highway crossings are not subject to discovery or admitted into evidence in a Federal or State court proceeding or considered for other purposes in any action for damages arising from any occurrence at a location mentioned or addressed in such reports, surveys, schedules, lists, or data.

[^14]:    Under 23 U.S. Code § 148 and 23 U.S. Code $\S 407$, safety data, reports, surveys, schedules, and lists compiled or collected for the purpose of identifying, evaluating, or planning the safety enhancement of potential crash sites, hazardous roadway conditions, or railway-highway crossings are not subject to discovery or admitted into evidence in a Federal or State court proceeding or considered for other purposes in any action for damages arising from any occurrence at a location mentioned or addressed in such reports, surveys, schedules, lists, or data.

[^15]:    Under 23 U.S. Code § 148 and 23 U.S. Code § 407, safety data, reports, surveys, schedules, and lists compiled or collected for the purpose of identifying, evaluating, or planning the safety enhancement of potential crash sites, hazardous roadway conditions, or railway-highway crossings are not subject to discovery or admitted into evidence in a Federal or State court proceeding or considered for other purposes in any action for damages arising from any occurrence at a location mentioned or addressed in such reports, surveys, schedules, lists, or data.

[^16]:    Under 23 U.S. Code § 148 and 23 U.S. Code § 407, safety data, reports, surveys, schedules, and lists compiled or collected for the purpose of identifying, evaluating, or planning the safety enhancement of potential crash sites, hazardous roadway conditions, or railway-highway crossings are not subject to discovery or admitted into evidence in a Federal or State court proceeding or considered for other purposes in any action for damages arising from any occurrence at a location mentioned or addressed in such reports, surveys, schedules, lists, or data.

[^17]:    Under 23 U.S. Code § 148 and 23 U.S. Code § 407, safety data, reports, surveys, schedules, and lists compiled or collected for the purpose of identifying, evaluating, or planning the safety enhancement of potential crash sites, hazardous roadway conditions, or railway-highway crossings are not subject to discovery or admitted into evidence in a Federal or State court proceeding or considered for other purposes in any action for damages arising from any occurrence at a location mentioned or addressed in such reports, surveys, schedules, lists, or data.

[^18]:    Under 23 U.S. Code § 148 and 23 U.S. Code § 407, safety data, reports, surveys, schedules, and lists compiled or collected for the purpose of identifying, evaluating, or planning the safety enhancement of potential crash sites, hazardous roadway conditions, or railway-highway crossings are not subject to discovery or admitted into evidence in a Federal or State court proceeding or considered for other purposes in any action for damages arising from any occurrence at a location mentioned or addressed in such reports, surveys, schedules, lists, or data.

[^19]:    Under 23 U.S. Code § 148 and 23 U.S. Code § 407, safety data, reports, surveys, schedules, and lists compiled or collected for the purpose of identifying, evaluating, or planning the safety enhancement of potential crash sites, hazardous roadway conditions, or railway-highway crossings are not subject to discovery or admitted into evidence in a Federal or State court proceeding or considered for other purposes in any action for damages arising from any occurrence at a location mentioned or addressed in such reports, surveys, schedules, lists, or data.

[^20]:    Under 23 U.S. Code § 148 and 23 U.S. Code § 407, safety data, reports, surveys, schedules, and lists compiled or collected for the purpose of identifying, evaluating, or planning the safety enhancement of potential crash sites, hazardous roadway conditions, or railway-highway crossings are not subject to discovery or admitted into evidence in a Federal or State court proceeding or considered for other purposes in any action for damages arising from any occurrence at a location mentioned or addressed in such reports, surveys, schedules, lists, or data.

[^21]:    Under 23 U.S. Code § 148 and 23 U.S. Code § 407, safety data, reports, surveys, schedules, and lists compiled or collected for the purpose of identifying, evaluating, or planning the safety
     or considered for other purposes in any action for damages arising from any occurrence at a location mentioned or addressed in such reports, surveys, schedules, lists, or data.

[^22]:    Under 23 U.S. Code § 148 and 23 U.S. Code § 407, safety data, reports, surveys, schedules, and lists compiled or collected for the purpose of identifying, evaluating, or planning the safety
     or considered for other purposes in any action for damages arising from any occurrence at a location mentioned or addressed in such reports, surveys, schedules, lists, or data.

[^23]:    Under 23 U.S. Code § 148 and 23 U.S. Code § 407, safety data, reports, surveys, schedules, and lists compiled or collected for the purpose of identifying, evaluating, or planning the safety
     or considered for other purposes in any action for damages arising from any occurrence at a location mentioned or addressed in such reports, surveys, schedules, lists, or data.

[^24]:    Under 23 U.S. Code § 148 and 23 U.S. Code § 407, safety data, reports, surveys, schedules, and lists compiled or collected for the purpose of identifying, evaluating, or planning the safety
     or considered for other purposes in any action for damages arising from any occurrence at a location mentioned or addressed in such reports, surveys, schedules, lists, or data.

[^25]:    Under 23 U.S. Code § 148 and 23 U.S. Code § 407, safety data, reports, surveys, schedules, and lists compiled or collected for the purpose of identifying, evaluating, or planning the safety
     or considered for other purposes in any action for damages arising from any occurrence at a location mentioned or addressed in such reports, surveys, schedules, lists, or data.
